Appendix A:
Additional Site Information

This page intentionally left blank.

APPENDIX A – ADDITIONAL SITE INFORMATION

This appendix provides an overview of the study site and the individual treatment features that were studied. Greater detail is available in the project Quality Assurance Project Plan (QAPP; King County 2015).

Echo Lake is a small stormwater-fed lake that drains to the larger Lake Ballinger, and is part of the McAleer Creek basin. The Echo Lake drainage basin is 207[1] acres and comprised of seven stormwater conveyance subbasins. Land use in this basin is predominantly urban, with 30% designated as commercial and 40% as residential landuse (City of Shoreline). Over 56% of the basin is impervious surface (HDR 2011). The Aurora Corridor runs north to south within about 350 feet of the western edge of Echo Lake.

Section 1.1.2 of the project QAPP (King County 2015) provides a detailed account of the changes to stormwater infrastructure in the basin, but a brief description is provided here. The basin did not include any targeted water quality treatment until retrofits were implemented by the City of Shoreline. Retrofitting along the Aurora Corridor from N 185th Street to N 192nd Street was initiated in 2011 and completed in 2012. Retrofitting along the Aurora Corridor from N 192nd Street to N 200th Street began in 2014 and was completed in 2016. The retrofit included a number of best management practice (BMP) installations, but the most numerous were the bioretention planter boxes (BPBs) and Filterra®, which were evaluated in this study. The BPBs were installed to treat 1.02 acres in total and the Filterra were designed to treat 1.86 acres in total. A detention tank system was also added to provide flow control to stormwater in route to Echo Lake through the main outfall.

The retrofit included additional changes to the stormwater system that impacted the comparability of pre- and post-retrofit samples collected to assess system-wide stormwater quality (Section 2.2 of the main report). Drainage from a relatively large subbasin (>70 acres), which previously discharged to a separate outfall, was rerouted in December 2014 to the DTS and now discharges through the main outfall starting. Representative sampling was no longer possible at the main outfall after the retrofit and other nearby construction. Instead, samples from the DTS outlet were used in the comparison. This location does not incorporate drainage from a small subbasin (8 acres) that joins the stormwater line to the main outfall after the DTS outlet point. These changes are also documented in the project QAPP (King County 2015).

Figure A-1 is a map of the study site including details about the stormwater system, and the installations included in the study. Figure A-2 illustrates how the installations are connected within the stormwater system. The following pages include descriptions, illustrations, and sampling strategies for the BPBs, Filterra, and DTS.

[1] The basin used to be 215 acres before the most north-western portion of the stormwater system was rerouted to a different basin as part of the retrofit.

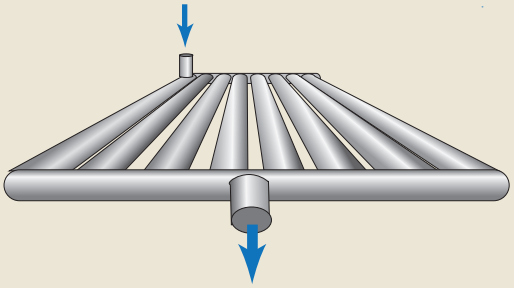
DETENTION TREATMENT SYSTEM (DTS)

The DTS receives drainage from 125 acres, including 70 acres of impervious surface.



FLOW CONTROL STRUCTURE

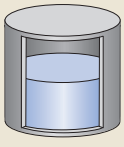


Table A-1. Bioretention planter box design and comparability to Stormwater Management Manual for Western Washington (SWMMWW)

Installation Type	Design Description	2012 SWMMWW Citation	Design Deviation
Bioretention Planter Box	Designed soil mix (40% cedar grove compost, 60% mineral aggregate, by volume), planted with trees, shrubs, and grasses within a vertical walled concrete and cement container. The planter boxes are completely impervious, and include an underdrain. Each feature treats between 0.05 and 0.13 acres. These are designed for enhanced treatment (basic and dissolved metals treatment)	BMP T7.30	No, follows 2005 and 2012 SWMMWW

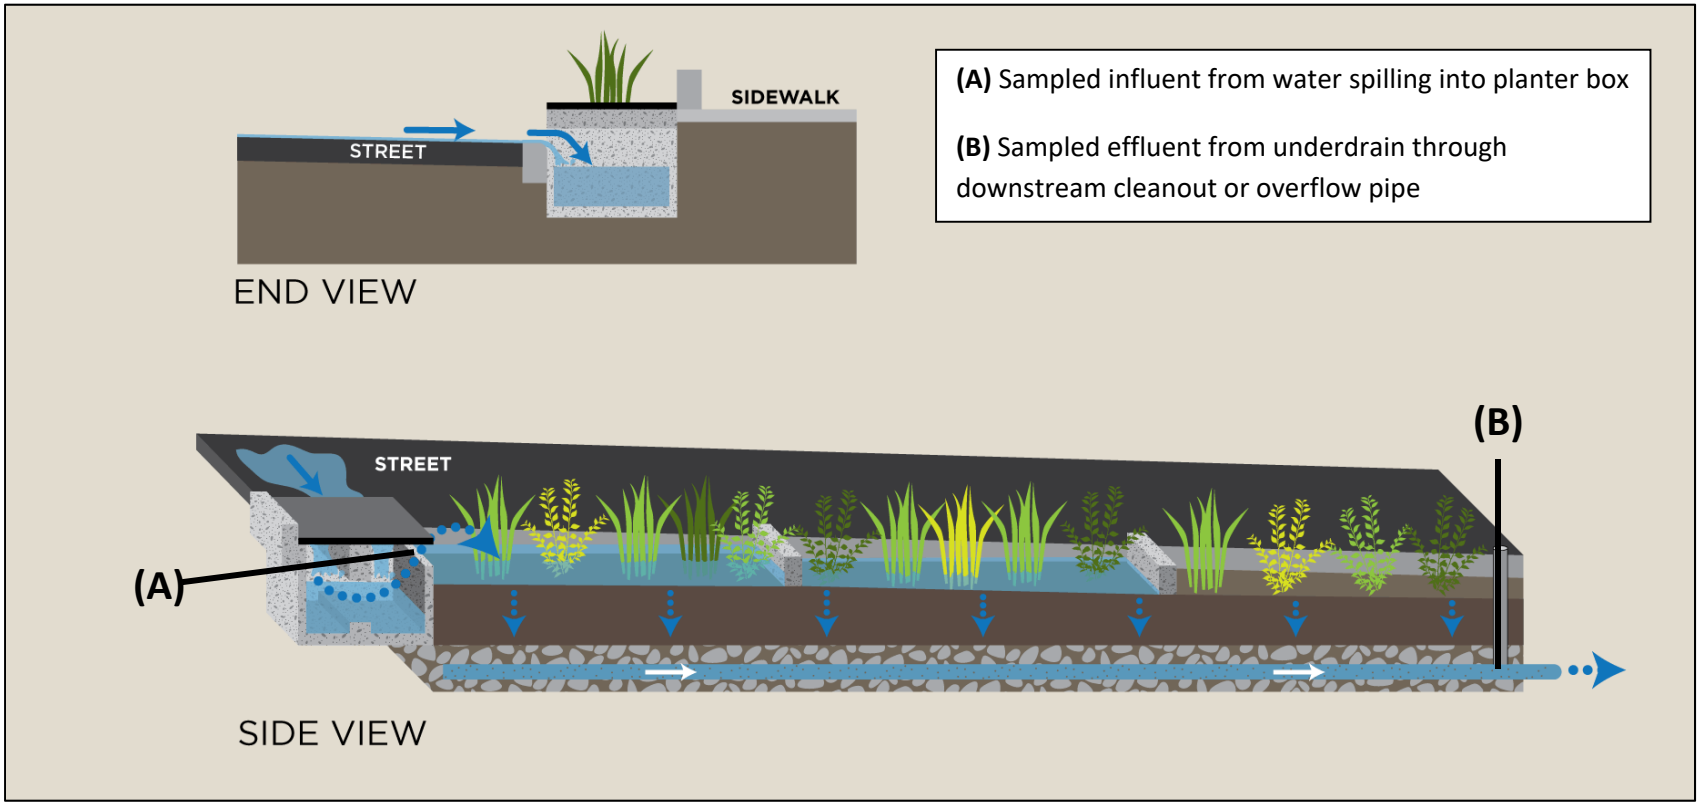

Figure A-3. Bioretention Planter Box Design and Sampling Strategy

Table A-2. Filterra® design and comparability to Stormwater Management Manual for Western Washington (SWMMWW)

Installation Type	Design Description	2012 SWMMWW Citation	Design Deviation
Filterra®	Proprietary soil mix planted with a single tree. Higher infiltration rates than bioretention. Are concrete-lined and underdrained. These are intended for enhanced and phosphorus treatment. Each feature treats between 0.05 and 0.23 acres.	Section 12.5; GULD for Americast Filterra® [1]	No

[1] GULD – general use level designation;http://www.ecy.wa.gov/programs/wq/stormwater/newtech/use_designations/FILTERRAguld.pdf

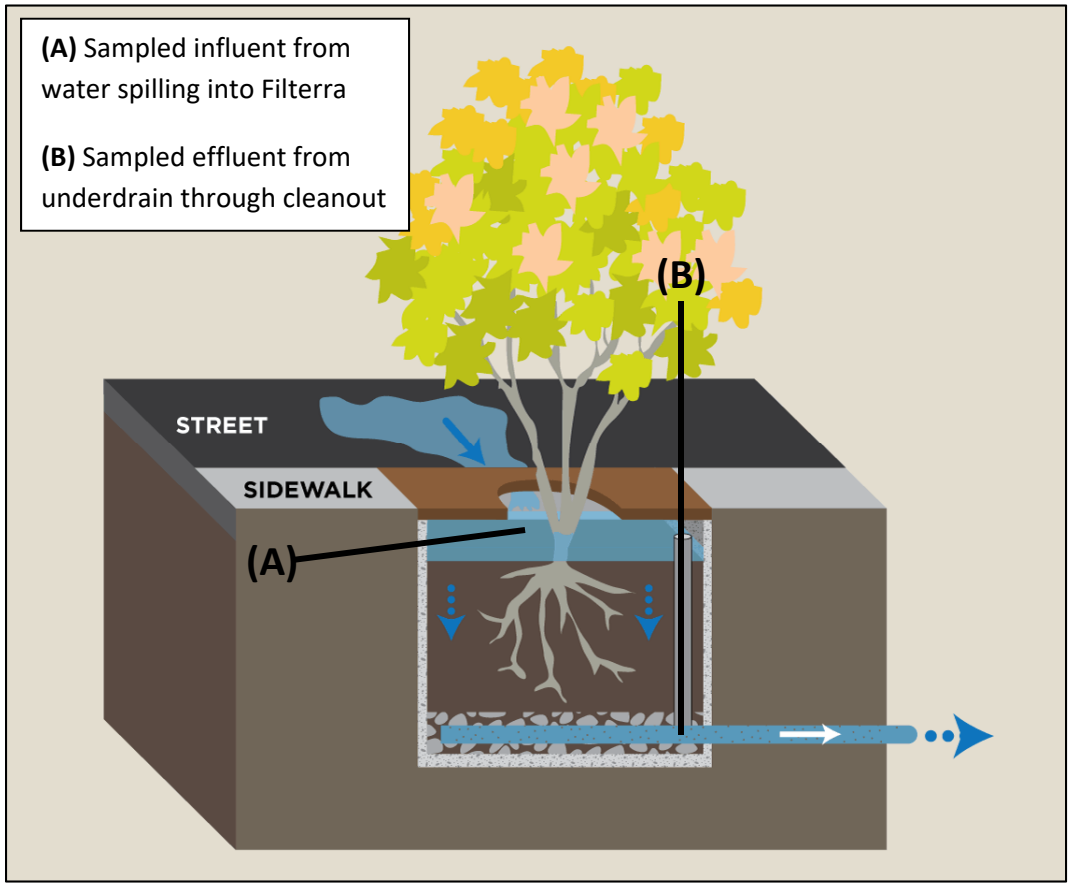

Figure A-4. Filterra Design and Sampling Strategy

Table A-3. Detention tank system design and comparability to Stormwater Management Manual for Western Washington (SWMMWW)

Installation Type	Design Description	2012 SWMMWW Citation	Design Deviation
DTS	Detention tank with a system of eight-foot diameter corrugated metal pipes, for a total length of 350 feet. The total capacity is 17,600 cubic feet. The tank is followed by a multiple orifice restrictor. This system is designed to handle all flow for the drainage basin (125 acres), but will provide flow control for 1.58 acres (total net new impervious surface).	Sections 3.2.2 and 3.2.4	TBD*

The final pages of this appendix include drainage details for the BPBs, Filterra, and DTS, with one page each.

ProjectWise Vault:

CONSTRUCTION NOTES

1) EACH UNIT SHALL BE CONSTRUCTED AT THE LOCATIONS AND ELEVATIONS ACCORDING TO THE SIZES SHOWN ON THE APPROVED DRAWINGS. ANY MODIFICATIONS TO THE ELEVATION OR LOCATION SHALL BE AT THE DIRECTION OF AND APPROVED BY THE ENGINEER.
2) IF THE FILTERRA IS STORED BEFORE INSTALLATION, THE TOP SLAB MUST BE PLACED ON THE BOX USING THE 2X4 WOOD PROVIDED, TO PREVENT ANY CONTAMINATION FROM THE SITE. ALL INTERNAL FITTINGS SUPPLIED (IF ANY), MUST BE LEFT IN PLACE AS PER THE DELIVERY.
3) THE UNIT SHALL BE PLACED ON A COMPACTED SUB-GRADE WITH A MINIMUM 6-INCH GRAVEL BASE MATCHING THE FINAL GRADE OF THE CURB LINE IN THE AREA OF THE UNIT. THE UNIT IS TO BE PLACED SUCH THAT THE UNIT AND TOP SLAB MATCH THE GRADE OF THE CURB IN THE AREA OF THE UNIT. COMPACT UNDISTURBED SUB-GRADE MATERIALS TO 95% OF MAXIMUM DENSITY AT +1 – 2% OF OPTIMUM MOISTURE. UNSUITABLE MATERIAL BELOW SUB-GRADE SHALL BE REPLACED TO THE SITE ENGINEER'S APPROVAL.
4) OUTLET CONNECTIONS SHALL BE ALIGNED AND SEALED TO MEET THE APPROVED DRAWINGS WITH MODIFICATIONS NECESSARY TO MEET SITE CONDITIONS AND LOCAL REGULATIONS.
5) ONCE THE UNIT IS SET, THE INTERNAL WOODEN FORMS AND PROTECTIVE MESH COVER MUST BE LEFT INTACT. REMOVE ONLY THE TEMPORARY WOODEN SHIPPING BLOCKS BETWEEN THE BOX AND TOP SLAB. THE TOP LID SHOULD BE SEALED ONTO THE BOX SECTION BEFORE BACKFILLING, USING A NON SHRINK GROUT, BUTYL RUBBER OR SIMIALR WATERPROOF SEAL. THE BOARDS ON TOP OF THE LID AND BOARDS SEALED IN THE UNIT'S THROAT MUST **NOT** BE REMOVED. THE SUPPLIER (AMERICAST OR ITS AUTHORIZED DEALER) WILL REMOVE THESE SECTIONS AT THE TIME OF ACTIVATION. BACKFILLING SHOULD BE PERFORMED IN A CAREFUL MANNER, BRINGING THE APPROPRIATE FILL MATERIAL UP IN 6" LIFTS ON ALL SIDES. PRECAST SECTIONS SHALL BE SET IN A MANNER THAT WILL RESULT IN A WATERTIGHT JOINT. IN ALL INSTANCES, INSTALLATION OF FILTERRA UNIT SHALL CONFORM TO ASTM SPECIFICATION C891 "STANDARD PRACTICE FOR INSTALLATION OF UNDERGROUND PRECAST UTILITY STRUCTURES", UNLESS DIRECTED OTHERWISE IN CONTRACT DOCUMENTS.
6) CURB AND GUTTER CONSTRUCTION (WHERE PRESENT) SHALL ENSURE THAT THE FLOW-LINE OF THE FILTERRA UNITS IS AT A GREATER ELEVATION THAN THE FLOW-LINE OF THE BYPASS STRUCTURE OR RELIEF (DROP INLET, CURB CUT OR SIMILAR). FAILURE TO COMPLY WITH THIS GUIDELINE MAY CAUSE FAILURE AND/OR DAMAGE TO THE FILTERRA ENVIRONMENTAL DEVICE.
7) EACH FILTERRA UNIT MUST RECEIVE ADEQUATE IRRIGATION TO ENSURE SURVIVAL OF THE LIVING SYSTEM DURING PERIODS OF DRIER WEATHER. THIS MAY BE ACHIEVED THROUGH A PIPED SYSTEM, GUTTER FLOW OR THROUGH THE TREE GRATE.
8) EACH FILTERRA UNIT SHALL USE THE UA CHINOOK ORNAMENTAL GRATE.

ACTIVATION

1) ACTIVATION OF THE FILTERRA UNIT IS PERFORMED ONLY BY THE SUPPLIER. PURCHASER IS RESPONSIBLE FOR FILTERRA INLET PROTECTION AND SUBSEQUENT CLEAN OUT COST. THIS PROCESS CANNOT COMMENCE UNTIL THE PROJECT SITE IS FULLY STABILIZED AND CLEANED (FULL LANDSCAPING, GRASS COVER, FINAL PAVING AND STREET SWEEPING COMPLETE), NEGATING THE CHANCE OF CONSTRUCTION MATERIALS CONTAMINATING THE FILTERRA SYSTEM. CARE SHALL BE TAKEN DURING CONSTRUCTION NOT TO DAMAGE THE PROTECTIVE THROAT AND TOP PLATES.
2) ACTIVATION INCLUDES INSTALLATION OF PLANT(S) AND MULCH LAYERS AS NECESSARY.

Appendix C:
Field Sampling Methods

This page intentionally left blank.

APPENDIX C - FIELD SAMPLING METHODS

This appendix provides an overview of the field sampling methods used in the study; greater detail is presented in the project QAPP (King County 2015). The sampling locations are described in Section C.1. Sections C.2 and C.3 summarize the sample collection and sample processing methods, respectively. Section C.4 describes the field sampling deviations from the QAPP. Photographs illustrating these sampling methods are included at the end of the appendix.

C.1 Sampling Locations

Stormwater samples were collected from the inlet and outlet of three BPB constructed in 2012, one BPB constructed in 2016, a Filterra constructed in 2012, and the DTS (Table C-1). These BPB and Filterra are located within the Echo Lake drainage basin and receive runoff from Aurora Ave N. (State Route 99) between N 185th St and N 200th St. Effluent from these treatment features is discharged back into the stormwater system. The DTS is located below ground at the Park and Ride on the corner of Aurora Ave N. and N 192nd St. This structure receives runoff from almost the entire drainage basin, including highway, residential, and commercial areas. Effluent from this structure discharges directly to Echo Lake. Figure A-1 identifies each sampled BPB, Filterra, and the inlet and outlet of the DTS. More detailed information about these structures is included in Appendix A and the project QAPP.

Table C-1. Echo Lake Stormwater Sampling Locations with Locator Names

Site Type	Locator Name*	Latitude	Longitude
Bioretention Planter Boxes (constructed in 2012)	ECHO-BP1-In	47.76749	-122.34573
	ECHO-BP1-Out	47.76760	-122.34573
	ECHO-BP2-In	47.76534	-122.34611
	ECHO-BP2-Out	47.76543	-122.34611
	ECHO-BP3-In	47.76685	-122.34572
	ECHO-BP3-Out	47.76695	-122.34572
Bioretention Planter Boxes (constructed in 2016)	ECHO-BP4-In	47.77263	-122.34580
	ECHO-BP4-Out	47.77271	-122.34580
Filterra (constructed in 2012)	ECHO-FLT1-In	47.76726	-122.34573
	ECHO-FLT1-Out	47.76727	-122.34572
Detention Tank System	ECHO-DTS-In	47.767697	-122.346477
	ECHO-DTS-Out	47.767634	-122.346277

*Locators are a unique name given to a sampling location and used in the KCEL database. Locators with the ending –In refer to the inlet of the treatment feature. Locators with the ending –Out refer to the outlet of the treatment feature.

C.2 Sample Collection

The QAPP provides a detailed description of sample collection procedures; however, there were several deviations from the QAPP, which are described in Section C.4. General procedures are summarized for the individual treatment features (BPB and Filterra) in Section C.2.1, and for the DTS in Section C.2.2.

C.2.1 General Procedures at the BPB and Filterra

As described in the QAPP, composite grab samples were collected at the inlet and outlet of each treatment feature using peristaltic pumps. Site-dedicated and pre-cleaned silicon tubing was used for each sampling event, and Teflon® tubing was pre-cleaned and site-dedicated. At each site, two-liter aliquots were generally collected every 20 to 30 minutes and composited in glass carboys. The QAPP specified up to 8.75 liters would be collected at each site over a period of at least two hours. In practice, up to 10 liters were collected at each site, usually over a period of 0.5 to 3 hours. These samples were not collected in relation to the hydrograph, but many composite sample collections spanned the entire effluent flow at the BPBs for a given storm event. Samples with less than the target volume were retained for analysis following the flow chart depicted in Figure 3 of the QAPP (King County 2015).

As specified in the QAPP, an additional 50 mL aliquot was filtered through a site-dedicated capsule filter (0.45µm) for each main sample aliquot collected. The QAPP specified that filtered aliquots would be composited at the KCEL, but in practice, field compositing was possible; therefore, filtered aliquots were composited into a 500 mL HDPE bottle as collected. Capsule filters were replaced when clogged, which occurred several times throughout a given sampling event. This filtered sample was collected for dissolved metals analysis, which requires filtering within 15 minutes of sample collection.

The QAPP specified that petroleum hydrocarbons samples would be collected directly into a dedicated container at the beginning of sampling. However, it was not possible to sample the effluent without the use of a peristaltic pump, due to the small opening of the clean out used to access the underdrain. Instead, grab samples were collected into a dedicated container using the peristaltic pump after the last aliquot was collected for the main composite sample. The project team anticipated that this procedure would prevent the loss of oils to equipment surfaces in two ways. One is by collecting this sample in a dedicated container, the splitting process is avoided, which would require the sample to pass through extra tubing while transferring containers. And second, by collecting the grab sample after all other sample aliquots have been collected, the tubing has already been coated with some oil, possibly preventing loss of oil from the final grab sample.

As described in the QAPP, field parameters were measured prior to each sampling event by collecting a volume of water in a pre-cleaned two-liter bucket using a peristaltic pump. Dissolved oxygen, temperature, pH and conductivity were measured using an EXO YSI Sonde, and turbidity will measured using a Hach 2100 Portable Turbidimeter.

C.2.2 Capturing Influent and Effluent at the BPB and Filterra

The QAPP specified general sample collection procedures; however, some details were honed during field visits after the QAPP was written. This section describes in detail how influent and effluent samples were collected at the BPB and Filterra over the course of this project.

Stormwater from the highway enters a catch basin system prior to reaching the BPBs (See Appendix A for layout). Influent samples were collected by holding the pump tubing at the surface of the water spilling from the catch basin into the BPB. While these samples likely contained a mixture of new stormwater and stormwater that had been sitting in the catch basin from previous storms, they were representative of the water entering the BPB.

There are no catch basins associated with the Filterra inlets. The QAPP directed that Filterra influent would be physically concentrated to sampling from the roadway; however, this was not necessary in practice. Instead, a small stainless-steel tray was placed on top of the mulch/media layer in the path of the sheet flow from the street. After several minutes of flushing, influent samples were collected from the surface of the water pooling in the stainless steel tray. Water continually overflowed from the tray into the media, so the Filterra continued functioning, but the walls of the tray prevented mulch debris from entering the sample line. This setup also allowed personnel to stay clear of the roadway.

Effluent samples for each BPB and the Filterra were collected from the underdrains, using overflows and/or clean outs for access (See Appendix B for details). The BPB underdrain was fairly deep, and so the pump tubing was secured within a PVC pole and lowered into the overflow or clean out until the tubing opening was submerged in the effluent flowing through the underdrain pipe. The Filterra underdrain was not visible, and so the pump tubing could not be placed using visual clues. Instead, with the pump running, the tubing was lowered into the clean out until effluent could be seen moving through the tubing. The tubing was held in place while the aliquot was collected.

C.2.3 General Procedures at the DTS

Flow meters were installed according to the procedures outlined in the QAPP, except for a number of deviations described in Section C.4. In the end, usable data were available for only a few months from the area velocity meter installed at the inlet.

Composite samples were collected using the GLS ISCO® autosamplers specified in the QAPP, but due to the flow monitoring issues, they could not be collected as flow-weighted samples. Instead time-weighted samples were collected using a visual level and start time to trigger sampling. Samples were collected over three to 11 hour timespans, depending on storm duration, with 250mL aliquots collected every 15 minutes. Otherwise, the procedures followed those described in the QAPP.

C.3 Sample Processing

Sample processing followed the procedures described in the QAPP. The samples were kept on ice and transported to KCEL where they were split into the appropriate sample containers, logged into the chain of custody, and stored at the appropriate storage temperatures until analysis. Samples for polychlorinated biphenyl (PCB) analysis were shipped to Pacific Rim Laboratories as described in the QAPP.

C.4 Additional deviations from the QAPP

- The QAPP specified that storms would qualify for sampling with at least 0.15 inches of rainfall during the storm event with an antecedent dry period of at least six hours with less than 0.04 inches of rainfall. In reality, these conditions did not sufficiently predict conditions that would generate effluent flow from the BPBs. Instead, the project team had to monitor the forecast for predicted rainfall greater than 0.03 inches per 15 minutes over at least two hours in order to target storms with the necessary intensity to produce effluent flow for sampling. This deviation was necessary to obtain samples for the study, but it resulted in sampling only high intensity storm conditions; however, this is still representative of treatment conditions at this site, because these are the only conditions under which effluent flow was observed at the BPBs.
- The QAPP specified that a second Filterra would be included in the study from the northern portion of the retrofit (completed in 2016). The design of this Filterra differed from the one sampled in the southern portion of the retrofit (completed in 2012) and the underdrain was much less accessible. The field crew could not access the effluent flow for sampling and so this site was dropped from the study.
- The QAPP specified that six to eight storms would be sampled at each BPB and Filterra. This sample goal was achieved at BPB1, BPB2, and BPB3. The Filterra developed drainage issues, and was not sampleable for the last two storms, meaning only five storms were sampled at this site. Only two storms were sampled at BPB4 due to insufficient effluent flow and delays in construction. The Filterra results were retained for analysis despite the small sample size, but only limited observations could be made with the BPB4 results.
- While the sample aliquots were generally collected at the BPBs between 20 and 30 minutes apart, as specified in the QAPP, there was one event where aliquots were collected a couple hours apart. This was because effluent from the BPB had stopped flowing during a period of lower intensity rain, and the project team had to wait until storm intensity increased and flow restarted. This event also had a timespan over 5 hours, because of this break midway through sampling. This deviation is not expected to affect data quality.
- One effluent sample at BPB2 (L64921-7) consisted of only one aliquot (i.e., single grab). This was because rainfall intensity diminished unexpectedly and effluent flows ceased before additional aliquots could be collected. Results for this sample were comparable to other effluent sample results, and retained for all data analysis.

- The filtered aliquots collected for dissolved metals were composited in the field instead of in the laboratory as specified in the QAPP. This did not affect the data quality.
- Sometimes sediment was present in the underdrains of BPB1 and BPB3. This sediment had likely built up during previous storms, and would not be representative of current conditions if captured in the sample. To prevent this, the underdrains were flushed with either reverse osmosis (RO) water from the laboratory or from rainwater collected in the field at least 30 minutes before samples were collected if sediment was present. This procedure was chosen to collect the most representative samples for each storm, but it does not provide information about the contaminants present in the sediment. While the water used to clear the sediment could potentially introduce contaminants into the outlet samples, the field crew minimized this risk by allowing the underdrains to flush with effluent for at least 10 minutes before sampling.
- The QAPP specified that flow would be monitored throughout the project with ISCO® 4230 air bubblers (level sensor-type flow meters) at both the inlet and outlet of the DTS. However, soon after the flow meters were installed, it became clear there were issues at both locations.
    - At the inlet, the pipe would often fill with water during storms, which is not a condition under which the air bubbler can correctly measure flow. The air bubble at the inlet was replaced with an ISCO 4250 area velocity meter on November 10, 2015, which can accurately measure flow in a full pipe.
    - At the outlet, an additional flow control structure intercepts the water before it proceeds to the outlet pipe where the flow meter was installed (Appendix A, page A-9). After recording questionable flow data during a couple storms, the field lead visited the site during a storm to assess the situation. The field lead observed water surging from the flow control structure into the outlet pipe. This non-uniform flow was causing the flow meter to record erroneous measurements. This issue was not resolved, and flow monitoring was discontinued at the DTS outlet site. This also necessitated modifying Study Objective #2 to exclude the evaluation of flow control effectiveness of the DTS. Additionally, since flow data was not recorded at the outlet, all samples collected at the DTS were time-weighted instead of flow-weighted as specified in the QAPP. Finally, due to technical errors, inlet flow data was not recorded during several months of the project. The collected flow data are available upon request.
- As mentioned in Section C.2.3, DTS samples timespans were shorter than those specified in the QAPP and they were time-weighted. Additionally, it is unclear what portion of the hydrograph was sampled, because the flow data was not reliable. Despite these deviations, the samples were successfully collected only during storm conditions and were retained for analysis unless additional data quality issues were expected (See Appendix G).

Appendix D:
Analytical Methods

This page intentionally left blank.

APPENDIX D - LABORATORY METHODS

A summary of analytical methods are presented in this section. The King County Environmental Laboratory (KCEL) reports both the reporting detection limit (RDL) and the method detection limit (MDL) for each sample and parameter, where applicable. PCB congeners were analyzed using high resolution isotopic dilution based methods, therefore MDL and RDL terms are less applicable because limits of quantitation are derived from calibration capabilities and ubiquitous, but typically low level equipment and laboratory blank contamination. As a result, PCB and dioxin/furan congener data are reported to lowest method calibration limits (LMCLs) and flagged as estimated down to the sample specific detection limit (SDL). In most cases the SDL is below the LMCL. The following sections provide a summary of the laboratory methods; greater detail can be found in the project QAPP (King County 2015).

D.1 KCEL Analysis

KCEL analyzed all parameters except PCBs. Standard Method SM5310B was used for TOC and DOC analysis, while Standard Method SM2540D was used for TSS analysis. Nutrients were analyzed using SM4500-P-F (orthophosphate phosphorus), SM4500-P-B, F (total phosphorus), SM4500-N-C (total nitrogen), SM4500-NO3-F (nitrate-nitrite nitrogen), and Kerouel & Aminot (1997; ammonia nitrogen).

Total and dissolved metals were analyzed and reported by EPA Method 200.8 (Inductively Coupled Plasma-Mass Spectrometry [ICP-MS]), KCEL SOP 624. The specific metals analyzed included: cadmium, copper, lead, and zinc. PAHs samples were prepared by liquid-liquid extraction in general agreement with EPA method 3520C. Samples were analyzed by a modified EPA Method 8270 Gas Chromatography/Mass Spectrometry – Selected Ion Monitoring method (GC/MS-SIM; KCEL SOP 731v5). The specific PAHs included: 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(g,h,i)perylene, benzo(a)pyrene, benzo(b,j,k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluorene, fluoranthene, indeno (1,2,3-cd)perylene, naphthalene, phenanthrene, and pyrene.

The QAPP specified bacteria would be analyzed as fecal coliforms using Standard Method SM9222D; however, there was interference in the cultures. After the first set of samples with interference, the laboratory began side-by-side analysis with *Escherichia coli* (*E. coli*) to test comparability. Starting in October 2016, fecal coliform analysis was dropped in favor of *E. coli* analysis for all remaining samples. *E. coli* was analyzed using Standard Method SM9213D/3B.

Toxicity tests were conducted for four sets of samples collected at one of the bioretention planter boxes (BPB1). For each event two toxicity tests were conducted: (1) a 48-hour acute test with *Daphnia pulex* following KCEL SOP #412v2 and EPA Test Method 2021.0 (acute *Daphnia pulex*), and (2) a 7-day chronic test with *Ceriodaphnia dubia* following KCEL SOP #408v3 and EPA Method 1002.0 (chronic *Ceriodaphnia dubia*).

D.2 PCB Analysis

PCBs are found in up to 209 different chemical forms, called congeners, and were measured using high resolution PCB congener analysis. Analysis followed EPA Method 1668 Revision C (EPA 2010), which is a high-resolution gas chromatography/high-resolution mass spectroscopy (HRGC/HRMS) method using an isotope dilution internal standard quantification. This method provides reliable analyte identification and very low detection limits. An extensive suite of labeled surrogate standards are added before samples are extracted. Data are "recovery-corrected" for losses in extraction and cleanup, and analytes are quantified against their most similar labeled analogues. The analysis included all 209 PCB congeners. Pacific Rim Laboratories (PRL) performed the PCB congener analysis according to their SOP LAB02. The samples were extracted followed by standard method clean-up, which includes an acid wash followed by Acid Silica, Carbon, and Alumina column chromatography. Analysis is performed with an SGE HT-8 column.

D.3 Deviations from the QAPP

- The QAPP specified that DOC and TOC would only be analyzed for effluent samples at the DTS; however, the project manager requested that DOC analysis be added to the BPB and Filterra samples starting in 2017, because of surprisingly low dissolved copper concentrations observed in the BPB effluent during an initial review of the data. The BPB samples collected on 12/8/2015 also included TOC and DOC analysis, although this was an unplanned deviation. This does not affect data quality, but provides additional information to the project.

Appendix E:
Data Analysis Methods

This page intentionally left blank.

APPENDIX E – DATA ANALYSIS METHODS

This section presents the methods used to prepare data for analysis, including the rules for: use of replicate data, significant figures, non-detect results, and determining sums for chemical groups (e.g., petroleum hydrocarbons [TPH-Dx], polycyclic aromatic hydrocarbons [PAHs] and polychlorinated biphenyls [PCBs]). Data analysis methods are also described, which include calculating percent reduction and statistical tests. Statistical test results are also presented.

E.1 Laboratory and Field Replicates

Laboratory and field replicates were considered quality control samples and were not used in data analysis, but rather as part of the data validation and quality control assessments.

E.2 Significant Figures

Chemical data generated by the King County Environmental Laboratory (KCEL) are reported to three significant figures, unless the value is below the reporting detection limit (RDL). In these cases, the value has higher uncertainty and is reported to only two significant figures. Pacific Rim Laboratories reports PCB congener results to three significant figures. PCB congener sums were also rounded to three significant figures. Appendix F presents the concentration data with appropriate significant figures.

E.3 Summation for TPH-Dx, PAH, and PCB Totals

Diesel-range and lube oil-range petroleum hydrocarbon results were summed for TPH-Dx. Total PAHs are the sum of 16 PAH compounds (Table E-1). Total PCBs are the sum of all detected concentrations of the 209 congeners. Results deemed non-detect by the laboratory or through data validation were not included in these sums. Some samples did not have any detected petroleum hydrocarbons or PAHs. In these cases, the highest MDL of the summed compounds was used as the level of detection.

Table E-1. PAH compounds included in total PAH sums.

PAH Compounds			
2-Methylnaphthalene	Benzo(a)anthracene	Chrysene	Indeno(1,2,3-Cd)Pyrene
Acenaphthene	Benzo(a)pyrene	Dibenzo(a,h)anthracene	Naphthalene
Acenaphthylene	Benzo(b,j,k)fluoranthene	Fluoranthene	Phenanthrene
Anthracene	Benzo(g,h,i)perylene	Fluorene	Pyrene

E.4 Use of Non-detect Result Values

Non-detect results were included in summary statistics, report figures, percent reduction calculations, and statistical tests using the MDL as the sample value. This method results in a high bias for data summaries with non-detects and increases uncertainty in other calculations and statistical tests. In most cases, parameters were detected in the influent, but not the effluent. This suggests that high bias may be introduced to the effluent results,

but not the influent results. Therefore, percent reductions and statistically significant decreases calculated from this dataset provide a conservative estimate of stormwater treatment. However, to help mitigate this uncertainty, parameters were included in statistical analyses only if frequency of detection was greater than 75%.

E.5 Statistical Analysis

This section describes the methods used for statistical analysis presented in the main report and appendices.

Differences between Influent and Effluent Chemical Concentrations – Data Preparation

All representative sample results for samples collected from the bioretention planter boxes (BPBs), the Filterra®, and the detention tank system (DTS) were included in the following analyses. However, one influent sample at the DTS (L65650-1) was deemed "not representative" as described in Section G1.6 of Appendix G. Data for the influent and effluent sample pair (L65650-1 and -3, sampled 6/23/2016) are not included in the sample summary table (Table 1 in the main report) and were not retained for any data analyses associated with this report. However, these sample results were included in the data validation (Appendix G) and full list of validated results (Appendix F).

Differences between Influent and Effluent – Paired Permutation Tests

Statistically significant reductions in concentration between influent and effluent were determined for individual BPBs (BPB1, BPB2, and BPB3), the Filterra, and the DTS using a one-sided paired permutation test (Sections 2.1 and 2.2 in the main report). This test was conducted in R (version 3.2.1; R Core Team 2017). The code is included on page E-5. The test determines whether decreases in concentration (between influent and effluent) are greater than would be expected by chance. This is accomplished by calculating signed differences between influent and effluent pairs, then generating many permutations of this dataset by randomly assigning a positive or negative difference (i.e., multiplying by 1 or -1). The mean difference in concentration is then recalculated for each permutation. The mean difference calculated with the original dataset is then compared to those generated by the permutations. If the observed mean difference is within the top 5% of the permutation results, then the decrease is greater than would be expected by chance – the mean reduction in concentration is statistically significant with p-value <0.05 (Figure E-1).

This test is similar to a paired t-test, except it is does not require the assumption of normal distribution. Instead, it uses the sampled distribution by resampling from the actual dataset. This test is also favorable because it tests on means, unlike the one-tailed Wilcoxon signed-rank test, which is used to determine if population mean ranks differ (recommended in Technology Assessment Protocol – Ecology [TAPE]; Ecology 2011). Permutation test results are presented in Table E-2.

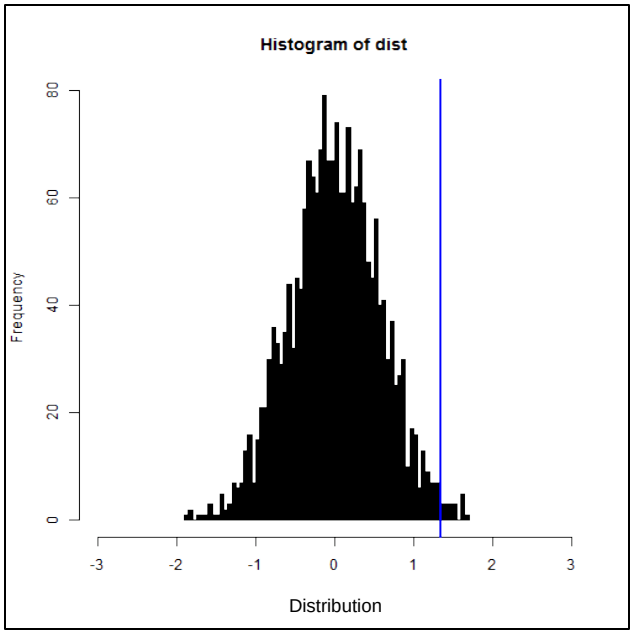

Figure E-1. Example of permutation results. Black bars indicate frequency of permutated difference and blue line signifies the observed difference.

Mean Percent Reductions with 95% Confidence Intervals - Bootstrapping

The 95% confidence intervals around mean percent reductions were calculated using R for individual BPBs (BPB1, BPB2, and BPB3), all BPBs combined (including BPB4), the Filterra, and the DTS using bootstrapping as described in TAPE (Ecology 2011). The "boot" function in the "boot" package for R was used (Canty and Ripley 2017). This test was first performed for the complete dataset for each parameter and then again for parameters included in TAPE using only the sample pairs for which influent concentrations were within the TAPE-specified influent range (Table 2 in Ecology 2011). Results for these analyses are presented in Table E-3 and Table E-4, respectively. Table 2 in the main report summarizes the mean percent reductions based on the lowest 95% confidence interval for each parameter and site (Table E-3).

Toxicity Test Results – CETIS Statistical Analysis

Toxicity tests were conducted to address Objective 1 described in the main report (Section 2.1). Appendix H2 includes a brief summary of the results with full reports included in Appendix F3).

The KCEL Aquatic Toxicology Unit uses the Comprehensive Environmental Toxicity Information System (CETIS) statistical package to assess toxicity (CETIS V1.8.7.16). This program compares the toxicity endpoints[1] between environmental samples and negative control samples for each toxicity test. When available, the low hardness negative control was used for this comparison. To meet the project objectives, these statistical comparisons were repeated between the influent and effluent sample pairs for each sample event.

[1] Percent survival is the endpoint used for the acute toxicity test (*Daphnia pulex*), while both percent survival and mean reproduction are used as the endpoints for the chronic toxicity tests (*Ceriodaphnia dubia*).

The specific statistical tests used for these data were based on dataset characteristics such as normal-distribution, equal variance, and equal number of replicates. The United States Environmental Protection Agency (EPA) methods for interpreting toxicity data provide flow charts to determine which statistical test to use (acute test: Figure 12 in EPA 2002a, and chronic test: Figure 2 in EPA 2002b). Appendix A of the CETIS User's Guide describes the statistical tests used by the program (Tidepool Scientific 2011). The statistical results are presented in the reports for each toxicity test (Appendix F3).

Relationships between Parameters – Linear Regression

Appendix H3 describes the use of linear regressions to describe how certain parameters may be related. Linear regressions were conducted using Microsoft Excel 2010, which uses least-squares fit. The R^2 values are presented on the scatter plots included in Appendix H3.

Echo Lake Water Quality Monitoring Summary – Data Preparation

Appendix H6 describes the data analysis conducted on the Echo Lake water quality monitoring data. For most analyses the data were grouped by year and were not differentiated between months. Data collection included samples for nutrient data collected in April during some years, but for most years, nutrient data were collected only from May through October. To maintain data comparability across years, the April results were not included in the data analysis. Additionally, in 2014 fecal coliform was analyzed only in samples collected in May and June; therefore, 2014 data were not included in the analyses. Fecal coliform results for three samples were less than the method detection limit; the MDL of 1 was used for these results. Finally, the bacteria dataset used for this analysis included only the samples collected as part of the weekly monitoring effort.

Echo Lake Water Quality Monitoring Summary – Wilcoxon Rank-Sum Test

Wilcoxon Rank-Sum Tests (or Mann-Whitney U tests) were conducted using Sigma Plot v12.5 to compare median nutrient concentrations and bacteria counts between pre- and post-retrofit years. This is a non-parametric test that estimates whether the difference in medians between two groups is greater than would be expected by chance. Two-sided p-values less than 0.05 were used to indicate statistically significant differences. Table E-5 lists these results.

R Code for Paired Permutations

```

Dear Carly:

The summary of a 7-day (*Ceriodaphnia*) test and a 48-hour (*Daphnia*) test conducted on storm water samples collected from an Echo Lake rain garden site on January 21, 2016 is shown in the table below. Tests were initiated January 26 and 27, 2016. Detailed findings and method descriptions are in the "RESULTS" and "METHODS" sections of the attached report. Statistical data analysis was performed in CETIS V1.8.7.16.

Report Date: **July 20, 2016**

METHODS

SAMPLES

Two storm water samples were collected at Echo Lake Rain Garden #1 Inlet and Outlet sites on January 21 (Event 1) and March 9 (Event 2), 2016. Approximately 3 to 7L of each sample was delivered to the King County Environmental Laboratory (KCEL) in 2.5 gallon glass screw-cap jars with minimal headspace and tested as received. The samples were stored in the dark at 4 ± 2°C and used to initiate the *Daphnia pulex* acute and the *Ceriodaphnia dubia* chronic toxicity tests, as well as for *C. dubia* test renewals.

Collection information and chemical characteristics of the test samples are listed in the table below.

	EVENT 1		EVENT 2

CONTROL WATER

The control water for tests with *Daphnia pulex* is fresh water obtained from a 95 ft. deep well located at the KCEL and filtered to 60 µm with Nitex screen before use. *D. pulex* are routinely maintained in static-renewal cultures of well water (WW) at 20 ± 1°C.

Water used for testing and culturing with *Ceriodaphnia* is fresh water obtained monthly from Lake Washington at a site midway between the I-90 and 520 bridges and filtered through 60 µm Nitex screen before use.

Metals by ICP are measured monthly (last analysis: 5-2016); metals by ICP/MS or CVAA and organic compounds are measured annually (last analyses: 02 & 03-2016). Hardness, alkalinity, conductivity and pH are measured at the beginning of each test.

Physical-chemical characteristics of the WW and LWW are listed in the following table:

Parameter	WW Values		LWW Values		Units
	10-16-15	1-18-16	1-21-16	2-29-16	
Temperature	NA	16.9	NA	NA	°C, adjusted as necessary

ACUTE TOXICITY TESTS

Water Flea - *Daphnia pulex* – 48-Hour Static Acute Test

Events 1 and 2

The *Daphnia* acute toxicity tests followed the methods of US EPA (2002a). Test animals were neonates (< 24-hours old) taken from an overnight brood board; parent animals were adults isolated from in-house mass cultures. Samples were tested as received at one undiluted (100%) concentration along with a WW-only control. Test chambers were 30-mL beakers containing 25 mL of test solution. Individual broods were blocked across treatments such that each replicate contained representatives of five separate broods, with four replicates per treatment. Test chambers were randomized at the start of the test. The test was incubated at 20.0 ± 1.0°C for 48 hours on a 16:8 hour light:dark cycle. Survival and water quality measurements were recorded every 24 hours. Temperature was measured daily by digital thermometer in replicate blanks at six positions of the test tray (4 outer corner + 2 center). In addition, incubator temperature was measured at 15-minute intervals using an Onset Tidbit data logger. Temperature, pH and dissolved oxygen (D.O.) values can be found on the attached photocopied pages from the laboratory notebook in the "Storm Water Tests" section of this report.

Test #	LIMS Sample #	Start Date/ Time	End Date/ Time	Sample Concentrations (%)	Daphnid Age	# Reps/ Trtmt	# Orgs/ Rep
7871 (Event 1)	L64648	1-26-16/ 1400h	1-28-16/ 1455h	0 (WW control), 100%	< 24 hr	4	5
7898 (Event 2)	L64999	3-11-16/ 1255h	3-13-16/ 1300h	0 (WW control), 100%	< 24 hr	4	5

CHRONIC TOXICITY TESTS

Water Flea - *Ceriodaphnia dubia* - 7-Day Chronic Static Renewal Test

Event 1 (No Dilutions)

The *Ceriodaphnia dubia* 7-day static renewal chronic toxicity tests were conducted as outlined in US EPA (2002b). Samples were tested as received at one undiluted (100%) concentration. Ten replicates containing one animal each were tested at each treatment, including the control. Test organisms were 3rd or 4th-brood neonates (< 24 hours old) taken from an in-house individual brood board of adults started from mass culture. Individual broods were blocked across treatments, and each replicate represented a different brood. The test was incubated at 25 ± 1.0°C for 7 days on a 16:8 h light:dark cycle. All test solutions were renewed daily. Reproduction, survival, temperature and water quality measurements were recorded every 24 hours. Temperature was measured daily in six test board temperature blanks (4 outer corner + 2 center) and at 15-minute intervals using an Onset "Tidbit" data logger placed in a beaker of water in the incubator. The pH and D.O. values measured during testing can be found on the attached photocopied pages from the laboratory notebook in the "Storm Water Tests" section of this report.

Test #	**LIMS Sample #**	**Start Date/ Time**	**End Date/ Time**	**Sample Concentrations (%)**	**Daphnid Age**	**# Reps/ Trtmt**	**# Orgs/ Rep**
7873	L64648-1, -3	1-27-16/ 1330h	2-3-16/ 1300h	0 (LWW control), 100%	< 24 hr	10	1

Event 1 (With Dilutions)

Due to toxicity observed in the Inlet sample in the first set of tests, a second chronic *C. dubia* test was initiated using the original samples diluted with LWW in a dilution series. Five concentrations of each sample were tested: 100, 50, 25, 12.5 and 6.25%, along with a 0% sample (LWW-only) control. Because an insufficient volume of the Outlet sample L64648-3 remained for conducting renewals, the test was run using 5 replicates of the this sample. The test was otherwise run as described above for the Event 1 test.

Test #	**LIMS Sample #**	**Start Date/ Time**	**End Date/ Time**	**Sample Concentrations (%)**	**Daphnid Age**	**# Reps/ Trtmt**	**# Orgs/ Rep**
7883	L64648-1	2-4-16/ 1450h	2-11-16/ 1443h	0 (LWW control), 6.25, 12.5, 25, 50, 100%	< 24 hr	10	1
"	L64648-3	"	"	"	"	5	"

Event 2 (No Dilutions)

The *C. dubia* chronic test with Event 2 storm water samples was conducted as described above for the Event 1 test, with no sample dilutions.

Test #	LIMS Sample #	Start Date/ Time	End Date/ Time	Sample Concentrations (%)	Daphnid Age	# Reps/ Trtmt	# Orgs/ Rep
7898	L64999-1, -3	3-11-16/ 1255h	3-13-16/ 1300h	0 (LWW control), 100%	< 24 hr	10	1

QUALITY CONTROL

Reference toxicant control results are summarized in the following table.

Test Organism:	*Daphnia*		*Ceriodaphnia*	
Test #:	7869	7905	7881	7904
Control Survival (%)	100	100	80	100
Criteria	≥ 90	≥ 90	≥ 80	≥ 80
Acceptable?	**Yes**	**Yes**	**Yes**	**Yes**
Survival LC50 (g/L)	2.79	3.17		
Lab Control Limits	2.44 - 4.36	2.43 – 4.36		
Acceptable?	**Yes**	**Yes**		
Control Reprod (# neos/adult)			33.8	36.8
Criteria			≥ 15	≥ 15
Acceptable?			**Yes**	**Yes**
PMSD for Reproduction (%)*			32.04	24.4
Criteria			13 – 47	13 - 47
Acceptable?			**Yes**	**Yes**
Reproduction IC25 (µg/L)			3.09	6.71
Lab Control Limits			0 – 5.29	0 – 6.07
Acceptable?			**Yes**	**No**

*Percent Minimum Significant Difference; determined by Dunnett's Multiple Comparison test (Steels Many-One Rank Test for unequal variance); ($\alpha = 0.05$)

NaCl was used as a reference toxicant in acute tests with *Daphnia*. Temperature, pH and dissolved oxygen measurements remained within acceptable limits throughout the reference toxicant tests for *Daphnia* (#7869 & #7905) (US EPA 2002a). Acute positive control tests met acceptability criteria regarding control survival, and the survival LC50 endpoints were within the control limits of the mean ± 2SD (US EPA, 2002a).

Cadmium nitrate was used as a reference toxicant in chronic toxicity tests with *Ceriodaphnia*. Temperature, pH and dissolved oxygen measurements remained within acceptable limits throughout the reference toxicant tests for *Ceriodaphnia* (#7881 & #7904) (US EPA 2002b). In addition, chronic tests met acceptability criteria regarding control survival and mean control reproduction. For test #7881, the reproduction IC25 fell within the control limits of mean ± 2SD (US EPA 2002b), whereas for #7904 it slightly exceeded the upper control limit. Because it met all other QC criteria, the test was retained. Reference toxicant tests with *Ceriodaphnia* were re-started in 2015 following a three-year hiatus. It is possible that a change in diet or culture health may have affected the response to the toxicant.

The precision tables located at the end of this report are constructed to monitor the sensitivity of the organisms to the reference toxicant and thereby provide an indication of their overall sensitivity to other compounds.

WATER QUALITY MONITORING

Methods and method numbers for water quality tests are listed in the following table:

Parameter	**Method**
Water Quality Tests	APHA (1992); US EPA (1991).
Temperature	Standard Mercury Thermometer (calibrated with a certified thermometer traceable to NBS records) and Onset, Tidbit (v2) UTBI-001 Temperature Logger (KCEL #436v1).
Dissolved Oxygen	YSI membrane electrode method (Method #4500-0 G; KCEL #434).
pH	Beckman 690 meter with automatic temperature compensation and Ross combination electrode (Method #4500-H; APHA 1992; KCEL #433).
Total Alkalinity	Potentiometric Method (Method #2320 B; KCEL #319v4).
Total Hardness	By calculation (Method #2340 B; KCEL #612v4).
Conductivity	Orion Model #122 Meter with 012210 conductivity cell (Method 2510B; KCEL #435).
Total Ammonia	Phenate Method (Standard Methods SM 4500 - NH_3-G; KCEL #330v4).
Unionized Ammonia	Calculated from total ammonia, pH and ionization constants (APHA Method #417 G).
Pesticides and PCB's	Continuous liquid extraction method (EPA Method #608; KCEL #733).
Organic Analysis	Continuous liquid extraction method for BNA's (EPA Method #625; KCEL #731).
Volatile Organics	Purge and trap method (EPA Method #624; KCEL #732).
Total Metals	ICP for Cd, Cr, Cu, Ni, Pb and Zn (EPA Method #200.7; KCEL #612v4); for Hg analysis (KCEL #604v5, 601v4, 605v0).

RESULTS

ACUTE TOXICITY TESTS

Water Flea - *Daphnia pulex* – 48-Hour Static Acute Test

Event 1 (No Dilutions): KCEL Test #7871

Survival results for the 48-hour *Daphnia* acute test with Event 1 storm water samples are listed in the table below.

Sample #	Station/ Site	% Sample	Percent Survival at 48 Hours					# *Daphnia* Tested
			% Survival in each rep. (n=5 *Daphnia*/rep)					
			Rep 1	Rep 2	Rep 3	Rep 4	Mean	
----	Well Water Control	0	100	100	100	100	**100**	20
L64648-1	ECHO-BP1-IN Rain Garden #1 (Inlet)	100	80	100	100	100	**95**	20
L64648-3	ECHO-BP1-OUT Rain Garden #1 (Outlet)	100	100	80	100	100	**95**	20

Survival was 100 % in the well water-only control and 95% in both the Inlet and Outlet storm water samples. Survival in both the Inlet and Outlet samples was not significantly reduced from the control ($p > 0.05$; Wilcoxon Rank Sum Test).

The unionized ammonia level in 100% Inlet and Outlet sample reached a maximum of 0.007 and 0.005 mg N/L, respectively, during the 48-hour test.

Event 2 (KCEL Test #7898)

Results are listed in the table below of the 48-hour acute test with *Daphnia* using Event 2 storm water samples.

Sample #	Station/ Site	% Sample	% Survival at 48 Hours					# *Daphnia* Tested
			% Survival in each rep. (n=5 *Daphnia*/rep)					
			Rep 1	Rep 2	Rep 3	Rep 4	Mean	
----	Well Water Control	0	100	100	100	100	**100**	20
L64999-1	ECHO-BP1-IN Rain Garden #1 (Inlet)	100	80	100	80	80	**85**$^{+}$	20
L64999-3	ECHO-BP1-OUT Rain Garden #1 (Outlet)	100	100	100	100	100	**100**	20

$^{+}$Different from control at ANOVA, but not significantly ($p > 0.05$; Wilcoxon Rank-Sum test)

Survival was 100% in the well water-only control and Outlet storm sample and 85% in the Inlet storm sample. Survival in the Inlet sample was decreased from the control and Outlet sample (at ANOVA) but not significantly ($p > 0.05$; Wilcoxon Rank-Sum test), whereas survival in the Outlet samples was not reduced from the control.

The unionized ammonia level in both the 100% Inlet and Outlet samples reached a maximum of 0.009 mg NH_3-N/L during the 48-hour test.

Water Flea - *Ceriodaphnia dubia* - 7-Day Chronic Static Renewal Test

Event 1 (KCEL Test #7873)

Reproduction and survival results over the 7-day chronic *Ceriodaphnia* test with Event 1 storm water samples are shown in the table below.

Sample #	Station	% Sample	Reproduction (Mean #Neonates/Adult in 7 Days) 1	2	3	4	5	6	7	8	9	10	Mean Reprod	Mean % Surv
---	LWW Control	0	28	12	49	48	51	30	16	5[+]	39	35	**34.2 (n = 9)**	90
L64648-1	ECHO-BP1-IN	100	23	34	21	14	38	8	34	19	24	23	**23.8***	50**
L64648-2	ECHO-BP1-OUT	100	5	45	46	42	24	41	4	41	28	30	**30.6**	80

[+] Outlier; omitted from analysis
*Significantly different from control ($p < 0.05$; 1-tailed t-Test) **Significantly different from control ($p < 0.05$; Fisher's Exact Test)

As shown in the table above, survival was 90% in the LWW-only control, 50% in the Inlet storm sample and 80% in the Outlet storm sample. In the Inlet sample, survival was significantly reduced from the control ($p < 0.05$; Fishers Exact Test), but not significantly ($p > 0.05$; Fishers Exact Test) in the Outlet sample.

Similarly, reproduction in the Inlet storm sample was significantly ($p < 0.05$; homoscedastic 1-tailed t-Test) less than the control but not significantly reduced from the control in the Outlet sample ($p > 0.05$; homoscedastic 1-tailed t-Test). Reproduction in the Inlet and Outlet sample did not differ significantly ($p > 0.05$; Tukey-Kramer and homoscedastic 1-tailed t-Test).

The unionized ammonia level in 100% Inlet and Outlet samples reached a maximum of 0.009 and 0.007 mg NH_3-N/L, respectively, during the 7-day test.

Event 1, with Dilutions (KCEL Test #7883)

Results of the 7-day Ceriodaphnia chronic renewal test run using a dilution series of Event 1 storm water samples are listed in the table below.

Sample #	Station	% Sample	Reproduction (Mean #Neonates/Adult in 7 Days) 1	2	3	4	5	6	7	8	9	10	Mean Reprod	Mean % Surv
---	LWW Control	0	36	34	34	34	32	33	28	32	36	35	**33.4**	100
L64648-1	ECHO-BP1-IN	6.25	38	25	32	9	32	35	29	30	36	36	**30.2**	100
		12.5	39	37	32	36	35	32	32	34	32	34	**34.3**	100
		25	32	36	33	37	32	37	32	35	52	27	**35.3**	100
		50	37	31	29	32	31	33	25	29	31	33	**31.1**	100
		100	29	23	27	28	27	32	23	32	24	32	**27.7***	100
L64648-3	ECHO-BP1-OUT	6.25	31	39	28	35	31						**32.8**	100
		12.5	37	35	34	36	31						**34.6**	100
		25	33	34	31	35	36						**33.8**	100
		50	32	31	31	38	35						**33.4**	100
		100	33	33	33	34	34						**33.4**	100

*Significantly different from control ($p < 0.05$; 1-tailed t-Test)

Survival was 100% in the LWW-only control and all concentrations of both the Inlet and Outlet storm samples.

For the Inlet sample, reproduction was significantly reduced from the control at the 100% sample ($p < 0.05$; Steel Many-One Rank Test); it was also less than the control at 6.25% and the 50% sample concentrations but not significantly ($p > 0.05$; Steel

Many-One Rank Test). The NOEC was calculated to be 50% sample. Because reproduction was not reduced by more than 25% at any concentration, an IC25 could not be calculated.

For the Outlet sample, reproduction was not reduced from the control at any sample concentration; therefore, an IC25 could not be calculated.

Reproduction in the Outlet sample did not differ significantly from the Inlet sample ($p > 0.05$; heterogeneous 1-tailed t-Test).

The unionized ammonia level in 100% Inlet and Outlet samples reached a maximum of 0.010 and 0.006 mg NH_3-N/L, respectively, during the 7-day test.

Event 2 No Dilutions (KCEL Test #7897)

Average reproduction and survival results at the end of the 7-day *Ceriodaphnia* chronic renewal test with Event 2 storm water samples are listed in the table below.

Sample #	Station	% Sample	Reproduction (Mean #Neonates/Adult in 7 Days)										Mean Reprod	Mean % Surv
			1	2	3	4	5	6	7	8	9	10		
---	LWW Control	0	19	16	20	17	20	18	18	9	19	18	**17.4**	100
L64999-1	ECHO-BP1-IN	100	8	18	18	20	22	23	19	24	21	19	**19.2**	100
L64999-3	ECHO-BP1-OUT	100	24	21	18	21	20	22	22	23	22	21	**21.4**	90

Survival was 100% in the LWW-only control and the Inlet sample and 90% in the Outlet sample. Survival in the Outlet sample was not significantly reduced from the control ($p > 0.05$; Fisher Exact/ Bonferroni t-Test).

Reproduction in both the Inlet and Outlet samples was not reduced from the control.

The unionized ammonia level in 100% Inlet and Outlet sample reached a maximum of 0.016 and 0.013 mg NH_3-N/L, respectively, during the 7-day test.

QUALITY CONTROL

Storm water sample and control performance results are summarized in the following table:

Test Organism:	*Ceriodaphnia*			*Daphnia*	
Test #:	7873	7883	7897	7871	7898
Control Survival (%)	90	100	100	100	100
Criteria	≥ 80	≥ 80	≥ 80	≥ 90	≥ 90
Acceptable?	**Yes**	**Yes**	**Yes**	**Yes**	**Yes**
Control Reproduction (# neos/adult)	34.2	33.4	17.4		
Criteria	≥ 15	≥ 15	≥ 15		
Acceptable?	**Yes**	**Yes**	**Yes**		
PMSD for Reproduction (%)*	27.7 (IN) 34.9 (OUT)	15.3 (IN)	17.3 (IN)		
Criteria	13-47	13-47	13-47		
Acceptable?	**Yes**	**Yes**	**Yes**		

*Percent Minimum Significant Difference; determined by Dunnett's Multiple Comparison test ($\alpha = 0.05$)

As shown in the table above, both the acute and chronic effluent tests met acceptability criteria regarding control performance and test variability, including survival, reproduction and PMSD (US EPA, 2002a & 2002b).

Dissolved oxygen, pH, temperature and/or salinity remained within acceptable limits throughout both the acute and chronic tests (US EPA, 2002a & 2002b). Water quality data recorded during testing is shown on the photocopied pages from the laboratory notebook in the "Effluent Tests" section of this report.

Dear Carly:

The summary of a 7-day (*Ceriodaphnia*) test and a 48-hour (*Daphnia*) test conducted on storm water samples collected from an Echo Lake rain garden site on October 26, 2016 is shown in the table below. The tests were initiated on October 28, 2016 and October 31, 2016 respectively. Detailed findings and method descriptions are in the "RESULTS" and "METHODS" sections of the attached report. Statistical data analysis was performed in CETIS V1.8.7.16.

Report Date: **March 28, 2017**

METHODS

SAMPLES

Storm water samples were collected at Echo Lake Rain Garden #1 Inlet and Outlet sites on October 26, 2016. Approximately 3 to 7L of each sample was delivered to the King County Environmental Laboratory (KCEL)in 9 Liter glass screw-cap jars with minimal headspace and tested as received. The samples were stored in the dark at 4 ± 2°C and used to initiate the *Daphnia pulex* acute and the *Ceriodaphnia dubia* chronic toxicity tests, as well as for *C. dubia* test renewals.

Collection information and chemical characteristics of the test samples are listed in the table below.

Site:	Echo Lake Rain Garden #1, INLET	Echo Lake Rain Garden #1, OUTLET
Station:	ECHO-BP1-IN	ECHO-BP1-OUT
KCEL Sample #:	L66498-1	L66498-3
Collect Date/Time	10/26/16 09:12	10/26/16 09:17
Rec'd Date/Time	10/26/16 14:40	10/26/16 14:40
Volume (L)	~ 1.5 gal (~ 6L)*	~ 1.5 gal (~ 6L)*
Temp (°C)	5.9	5.4
pH	7.404	7.030
D.O. (mg/L)	10.9	11.0
Total Alkalinity (mg/L as $CaCO_3$)	NA	NA
Total. Hardness (mg/L as $CaCO_3$)	8.99	12
Cond (µmhos/cm)	15	25.1

Tot P (mg/L)	0.0714	0.177
Tot NH_3 (mg/L)	0.118	0.0194

*Split from 9L glass jars in-house

CONTROL WATER

The control water for tests with *Daphnia pulex* is fresh water obtained from a 95 ft. deep well located at the KCEL and filtered to 60 µm with Nitex screen before use. *D. pulex* are routinely maintained in static-renewal cultures of well water (WW) at 20 ± 1°C.

Water used for testing and culturing with *Ceriodaphnia* is fresh water obtained monthly from Lake Washington at a site midway between the I-90 and 520 bridges and filtered through 60 µm Nitex screen before use.

Metals by ICP are measured monthly (last analysis: October 2016); metals by ICP/MS or CVAA and organic compounds are measured annually (last analyses: February and March 2016). Hardness, alkalinity, conductivity and pH are measured at the beginning of each test.

Physical-chemical characteristics of the WW and LWW are listed in the following table:

Parameter	LWW	Low Hardness LWW	WW	Low Hardness WW	Units
Sample Number:	L66510-1	L66510-2	L66510-3	L66510-4	
Temperature:	*	*	*	*	°C, adjusted as necessary
Conductivity:	102.1	27.8	30.1	25.9	µmhos/cm
pH:	7.805	7.536	8.159	7.598	
Total Hardness (calc.):	41.9	10.8	105	10.4	mg/L as $CaCO_3$
Total Alkalinity:	37.9	9.87	68.9	7.19	mg/L as $CaCO_3$

*Water held at 0-5°C cooler until needed.

CHRONIC TOXICITY TEST

Water Flea - *Ceriodaphnia dubia* - 7-Day Chronic Static Renewal Test (#8174)

The *Ceriodaphnia dubia* 7-day static renewal chronic toxicity tests were conducted as outlined in US EPA (2002b). Samples were tested as received at one undiluted (100%) concentration. Ten replicates containing one animal each were tested at each treatment, including the control. Test organisms were 3rd or 4th-brood neonates (< 24 hours old) taken from an in-house individual brood board of adults started from mass culture. Individual broods were blocked across treatments, and each replicate represented a different brood. The test was incubated at 25 ± 1.0°C for 7 days on a 16:8 h light:dark cycle. All test solutions were renewed daily. Reproduction, survival, temperature and water quality measurements were recorded every 24 hours. Temperature was measured daily in six test board temperature blanks (4 outer corner + 2 center) and at 15-minute intervals using an Onset "Tidbit" data logger placed in a beaker of water in the incubator. The pH and D.O. values measured during testing can be found on the attached photocopied pages from the laboratory notebook in the 'Storm Water Tests" section of this report.

Test #	LIMS Sample #	Start Date/ Time	End Date/ Time	Sample Concentrations (%)	Daphnid Age	# Reps/ Trtmt	# Orgs/ Rep
8174	L66498	10/28/17 0940	11/04/16 1010	0 (WW control), 0 (Low Hardness control), 100%	< 24 hr	10	1

RESULTS

Reproduction and survival results over the 7-day chronic *Ceriodaphnia* test # 8174 are shown in the table below:

Sample #	Station	% Sample	Reproduction (#Neonates/Adult in 7 Days)										Mean Reprod*	Mean % Surv
			1	2	3	4	5	6	7	8	9	10		
----	LWW Control	0	32	35	33	37	18	36	35	28	40	34	**32.8**	100
----	Low Hardness Control	0	36	30	31	37	36	31	33	35	35	35	**33.9**	100
L66498-1	ECHO-BP1-IN	100	17	31	5	25	30	27	25	11	0	24	**19.5**	60
L66498-2	ECHO-BP1-OUT	100	31	35	34	36	31	40	34	36	33	22	**33.2**	100

*Numbers based off of 3rd brood

As shown in the table above, survival was 100% in all samples except for the Inlet, where survival was 60%.

The Wilcoxon Rank Sum Two-Sample Test (Nonparametric-Two Sample) and an Equal Variance Two-Sample t-test (Parametric) were used to compare the inlet and outlet for both survival and reproduction. A significant reproduction effect was found between pairings for both survival and reproduction.

The unionized ammonia level in 100% Inlet and Outlet samples reached a maximum of **0.003** and **<0.001** mg NH_3-N/L, respectively, during the 7-day test.

ACUTE TOXICITY TEST

Water Flea - *Daphnia pulex* – 48-Hour Static Acute Test (#8175)

The *Daphnia* acute toxicity test followed the methods of US EPA (2002a). Test animals were neonates (< 24-hours old) taken from an overnight brood board; parent animals were adults isolated from in-house mass cultures. Samples were tested as received at one undiluted (100%) concentration along with a WW-only control. Test chambers were 30-mL beakers containing 25 mL of test solution. Individual broods were blocked across treatments such that each replicate contained representatives of five separate broods, with four replicates per treatment. Test chambers were randomized at the start of the test. The test was incubated at 20.0 ± 1.0°C for 48 hours on a 16:8 hour light:dark cycle. Survival and water quality measurements were recorded every 24 hours. Temperature was measured daily by digital thermometer in replicate blanks at six positions of the test tray (4 outer corner + 2 center). In addition, incubator temperature was measured at 15-minute intervals using an Onset Tidbit data logger. Temperature, pH and dissolved oxygen (D.O.) values can be found on the attached photocopied pages from the laboratory notebook in the "Storm Water Tests" section of this report.

Test #	LIMS Sample #	Start Date/ Time	End Date/ Time	Sample Concentrations (%)	Daphnid Age	# Reps/ Trtmt	# Orgs/ Rep
8175	L66498	10/31/16 1040	11/02/16 1050	0 (WW control), 0 (Low Hardness control), 100%	< 24 hr	4	5

RESULTS

Survival results for the 48-hour *Daphnia* acute test # 8175 are listed in the table below:

Sample #	Station/ Site	% Sample	Percent Survival at 48 Hours					# *Daphnia* Tested
			% Survival in each rep. (n=5 *Daphnia*/rep)				Mean % Survival	
			Rep 1	Rep 2	Rep 3	Rep 4		
----	Well Water Control	0	100	100	100	100	**100**	20
----	Low Harness Control	0	100	100	100	100	**100**	20
L66498-1	ECHO-BP1-IN Rain Garden #1 (Inlet)	100	100	100	100	100	**100**	20
L66498-3	ECHO-BP1-OUT Rain Garden #1 (Outlet)	100	100	100	100	100	**100**	20

Mean % Survival was 100 % in all samples.

The Wilcoxon Rank Sum Two-Sample Test (Nonparametric-Two Sample) and an Equal Variance Two-Sample t-test (Parametric) were used to compare the inlet and outlet. A non-significant effect was found.

The unionized ammonia level in 100% Inlet and Outlet sample reached a maximum of **0.002** and **<0.001** mg N/L, respectively, during the 48-hour test.

QUALITY CONTROL

Storm water sample and control performance results are summarized in the following table:

Test Organism:	*Ceriodaphnia*	*Daphnia*
Test #:	8174	8175
Control Survival (%)	100	100
Criteria	≥ 80	≥ 90
Acceptable?	**Yes**	**Yes**
Control Reproduction (# neos/adult)	32.8#	
Criteria	≥ 15	
Acceptable?	**Yes**	
PMSD* for Reproduction (%)	**NA**	
Criteria	**NA**	
Acceptable?	**NA**	

Based on 3rd brood.
*Percent Minimum Significant Difference

As shown in the table above, both the acute and chronic effluent tests met acceptability criteria regarding control, performance and test variability; including survival, and reproduction(US EPA, 2002a & 2002b).

Dissolved oxygen, pH, temperature and/or salinity remained within acceptable limits throughout both the acute and chronic tests (US EPA, 2002a & 2002b). Water quality data recorded during testing is shown on the photocopied pages from the laboratory notebook in the "Effluent Tests" section of this report.

Reference toxicant control results are summarized in the following table.

Test #:	*Daphnia* 8199	*Ceriodaphnia* 8178
Control Survival (%)	100	100
Criteria	≥ 90	≥ 80
Acceptable?	**Yes**	**Yes**
Survival LC50 (g/L)	3.8	
Lab Control Limits	3.4 – 4.2	
Acceptable?	**Yes**	
Control Reprod (# neos/adult)		37.8
Criteria		≥ 15
Acceptable?		**Yes**
PMSD for Reproduction (%)*		8.58
Criteria		13 - 47
Acceptable?		**Yes***
Reproduction IC25 (µg/L)		2.76
Lab Control Limits		0-7.29
Acceptable?		**Yes**

*Percent Minimum Significant Difference; PMSD slightly low, however all other QC is acceptable.

NaCl was used as a reference toxicant in the acute test with *Daphnia*. Temperature, pH and dissolved oxygen measurements remained within acceptable limits throughout the reference toxicant test for *Daphnia* (#8199) (US EPA 2002a). The acute positive control test met acceptability criteria regarding control survival, and the survival LC50 endpoint was within the control limits of the mean ± 2SD (US EPA, 2002a).

Cadmium nitrate was used as a reference toxicant in chronic toxicity tests with *Ceriodaphnia*. Temperature, pH and dissolved oxygen measurements remained within acceptable limits throughout the reference toxicant tests for *Ceriodaphnia* (#8178) (US EPA 2002b). In addition, chronic tests met acceptability criteria regarding control survival and mean control reproduction.

The precision tables located at the end of this report are constructed to monitor the sensitivity of the organisms to the reference toxicant and thereby provide an indication of their overall sensitivity to other compounds

WATER QUALITY MONITORING

Methods and method numbers for water quality tests are listed in the following table:

Parameter	Method
Water Quality Tests	APHA (1992); US EPA (1991).
Temperature	Standard Mercury Thermometer (calibrated with a certified thermometer traceable to NBS records) and Onset, Tidbit (v2) UTBI-001 Temperature Logger (KCEL #436v1).
Dissolved Oxygen	YSI membrane electrode method (Method #4500-0 G; KCEL #434).
pH	Beckman 690 meter with automatic temperature compensation and Ross combination electrode (Method #4500-H; APHA 1992; KCEL #433).
Total Alkalinity	Potentiometric Method (Method #2320 B; KCEL #319v4).
Total Hardness	By calculation (Method #2340 B; KCEL #612v4).
Conductivity	Orion Model #122 Meter with 012210 conductivity cell (Method 2510B; KCEL #435).
Total Ammonia	Phenate Method (Standard Methods SM 4500 - NH_3-G; KCEL #330v4).
Unionized Ammonia	Calculated from total ammonia, pH and ionization constants (APHA Method #417 G).
Pesticides and PCB's	Continuous liquid extraction method (EPA Method #608; KCEL #733).
Organic Analysis	Continuous liquid extraction method for BNA's (EPA Method #625; KCEL #731).
Volatile Organics	Purge and trap method (EPA Method #624; KCEL #732).
Total Metals	ICP for Cd, Cr, Cu, Ni, Pb and Zn (EPA Method #200.7; KCEL #612v4); for Hg analysis (KCEL #604v5, 601v4, 605v0).

Dear Carly:

A summary of 48-hour acute (*Daphnia*) and 7-day chronic (*Ceriodaphnia*) tests conducted with storm water samples collected from Echo Lake Rain Garden #1 Inlet and Outlet sites on January 17-18, 2017 is listed in the following table. The tests were initiated on January 24 and 19, respectively. Detailed findings and method descriptions are in the "RESULTS" and "METHODS" sections of the attached report. Statistical data analysis was performed in CETIS V1.8.7.16.

Event # 4 Collect 1/18/2017		***Ceriodaphnia* Survival & Reproduction Test Date 1/19/17**			***D. pulex* Acute Mortality Test Date 1/24/17**

	8245 *Ceriodaphnia* Chronic	**1/19/2017**

Report Date: **March 30, 2017**

METHODS

SAMPLES

Two storm water samples were collected by time-paced composite at Echo Lake Rain Garden #1 Inlet and Outlet sites on January 17, 2017. Approximately 2.5-3 L of each sample was split from a larger container and delivered to the King County Environmental Laboratory (KCEL) in 9-L glass jars with Teflon-lined screw-cap lids and tested as-received. The samples were stored in the dark at 4 ± 2°C and used to initiate the *Daphnia pulex* acute and the *Ceriodaphnia dubia* chronic toxicity tests, as well as for *C. dubia* test renewals.

Collection information and chemical characteristics of the test samples are listed in the table below.

Site:	Echo Lake Rain Garden #1-Inlet	Echo Lake Rain Garden #1-Outlet
Station:	ECHO-BP1-IN	ECHO-BP1-OUT
KCEL Sample #:	L66938-1	L66938-3
Coll Date/ Time From:	1-17-17/ 1435h	1-17-17/ 1433h
to:	1-17-17/ 1527h	1-17-17/ 1530h
Rec'd Date/Time	1-18-17/ 1126h	1-18-17/ 1126h
pH*	7.28	6.93

Tot P (mg/L)	0.242	0.287
Tot NH_3 (mg/L)	0.324	0.116

*Measured in field

CONTROL WATER

The control water for tests with *Daphnia pulex* is fresh water obtained from a 95 ft. deep well located at the KCEL and filtered to 60 µm with Nitex screen before use. *D. pulex* are routinely maintained in static-renewal cultures of well water (WW) at 20 ± 1°C. The well water is diluted by approximately a third with MilliQ SuperQ de-ionized water to bring the total hardness to usual levels.

Water used for testing and culturing with *Ceriodaphnia* is fresh water obtained monthly from Lake Washington (LWW) at a site midway between the I-90 and 520 bridges and filtered through 60 µm Nitex screen before use.

For LWW, low-hardness controls were prepared by diluting 1:10 with MilliQ water to approximate the hardness of the storm samples and receiving water.

Metals by ICP are measured monthly (last analysis: 1-2017); metals by ICP/MS or CVAA and organic compounds are measured annually (last analyses: 2-2017). Hardness, alkalinity, conductivity and pH are measured at the beginning of each test.

Physical-chemical characteristics of the WW and LWW are listed in the following table:

Parameter	WW 1-18-17	WW (adjusted TH)	LWW 1-9-17	Units
Temperature	13.8	---	NA	°C, adjusted as necessary
Conductivity	328	242	98.6	µmhos/cm
pH	8.05	8.08	7.72	
Total Hardness (calc.)	131	94.6	36	mg/L as $CaCO_3$
Total Alkalinity	72	45	100	mg/L as $CaCO_3$
Total Cd	< 2		< 2	µg/L

ACUTE TOXICITY TEST

Daphnia pulex – 48-Hour Static Acute Test #8248

The water flea *Daphnia* acute toxicity test #8248 followed the methods of US EPA (2002a). Test animals were neonates (< 24-hours old) taken from an overnight brood board; parent animals were adults isolated from in-house mass cultures. Because neonates from broods released on 1/21/17 were used in another test, the current test was started the following work day in order to have sufficient numbers of neonates. Samples were diluted with WW to the concentrations listed below, along with a WW-only control. Test chambers were 30-mL beakers containing 25 mL of test solution. Individual broods were blocked across treatments such that each replicate contained representatives of five separate broods, with four replicates per treatment. Test chambers were randomized at the start of the test. The test was incubated at 20.0 ± 1.0°C for 48 hours on a 16:8 hour light:dark cycle. Survival and water quality measurements were recorded every 24 hours. Temperature was measured daily by digital thermometer in replicate blanks at six positions of the test tray (4 outer corner + 2 center). In addition, incubator temperature was measured at 15-minute intervals using an Onset Tidbit data logger. Temperature, pH and dissolved oxygen (D.O.) values can be found on the attached photocopied pages from the laboratory notebook in the "Storm Water Tests" section of this report.

Test #	LIMS Sample #	Start Date/ Time	End Date/ Time	Sample Concentrations (%)	Daphnid Age	# Reps/ Trtmt	# Orgs/ Rep
8248	L66938-1, -3	1-24-17/ 1435h	1-26-17/ 1405h	0 (WW controls), 6.25, 12.5, 25, 50, 100	< 24 hr	4	5

CHRONIC TOXICITY TEST

Ceriodaphnia dubia - 7-Day Chronic Static Renewal Test #8245

The water flea *Ceriodaphnia dubia* 7-day static renewal chronic toxicity test #8245 was conducted as outlined in US EPA (2002b). Samples were tested as received at one undiluted (100%) concentration. Ten replicates containing one animal each were tested at each treatment, including a LWW-only control and a low-hardness LWW control. Test organisms were 3rd or 4th-brood neonates (< 24 hours old) taken from an in-house individual brood board of adults started from mass culture. Individual broods were blocked across treatments, and each replicate represented a different brood. The test was incubated at 25 ± 1.0°C for 7 days on a 16:8 h light:dark cycle. All test solutions were renewed daily. Reproduction, survival, temperature and water quality measurements were recorded every 24 hours. Temperature was measured daily in six test board temperature blanks (4 outer corner + 2 center) and at 15-minute intervals using an Onset "Tidbit" data logger placed in a beaker of water in the incubator. The pH and D.O. values measured during testing can be found on the attached photocopied pages from the laboratory notebook in the "Storm Water Tests" section of this report.

Test #	LIMS Sample #	Start Date/ Time	End Date/ Time	Sample Concentrations (%)	Daphnid Age	# Reps/ Trtmt	# Orgs/ Rep
8245	L66938-1, -3	1-19-17/ 1435h	1-26-17/ 1510h	0 (LWW controls), 100%	< 24 hr	10	1

QUALITY CONTROL

Reference toxicant control results are summarized in the following table.

	Daphnia	*Ceriodaphnia*
Test #:	8249	8250
Test Date:	2-1-17	2-3-17
Control Survival (%)	100	90
Criteria	≥ 90	≥ 80
Acceptable?	**Yes**	**Yes**
Survival LC50 (g/L)	3.42	
Lab Control Limits	2.39 – 4.65	
Acceptable?	**Yes**	
Control Reprod (# neos/adult)		39.8
Criteria		≥ 15
Acceptable?		**Yes**
PMSD for Reproduction (%)*		18.1
Criteria		13 - 47
Acceptable?		**Yes**
Reproduction IC25 (µg/L)		1.97
Lab Control Limits		0 – 7.25
Acceptable?		**Yes**

*Percent Minimum Significant Difference; determined by Dunnett's Multiple Comparison test (Steels Many-One Rank Test for unequal variance); ($\alpha = 0.05$)

NaCl was used as a reference toxicant in the acute test with *Daphnia*. Temperature, pH and dissolved oxygen measurements remained within acceptable limits throughout the reference toxicant test for *Daphnia* (#8249) (US EPA 2002a). The acute positive control test met acceptability criteria regarding control survival, and the survival LC50 endpoint was within the control limits of the mean ± 2SD (US EPA, 2002a).

Cadmium nitrate was used as a reference toxicant in the chronic toxicity test with *Ceriodaphnia*. Temperature, pH and dissolved oxygen measurements remained within acceptable limits throughout the reference toxicant test for *Ceriodaphnia*

(#8250) (US EPA 2002b). In addition, the chronic test met acceptability criteria regarding control survival and mean control reproduction (US EPA 2002b).

The precision tables located at the end of this report are constructed to monitor the sensitivity of the organisms to the reference toxicant and thereby provide an indication of their overall sensitivity to other compounds.

WATER QUALITY MONITORING

Methods and method numbers for water quality tests are listed in the following table:

Parameter	Method
Water Quality Tests	APHA (1992); US EPA (1991).
Temperature	Standard Mercury Thermometer (calibrated with a certified thermometer traceable to NBS records) and Onset, Tidbit (v2) UTBI-001 Temperature Logger (KCEL #436v1).
Dissolved Oxygen	YSI membrane electrode method (Method #4500-0 G; KCEL #434).
pH	Beckman 690 meter with automatic temperature compensation and Ross combination electrode (Method #4500-H; APHA 1992; KCEL #433).
Total Alkalinity	Potentiometric Method (Method #2320 B; KCEL #319v4).
Total Hardness	By calculation (Method #2340 B; KCEL #612v4).
Conductivity	Orion Model #122 Meter with 012210 conductivity cell (Method 2510B; KCEL #435).
Total Ammonia	Phenate Method (Standard Methods SM 4500 - NH_3-G; KCEL #330v4).
Unionized Ammonia	Calculated from total ammonia, pH and ionization constants (APHA Method #417 G).
Pesticides and PCB's	Continuous liquid extraction method (EPA Method #608; KCEL #733).
Organic Analysis	Continuous liquid extraction method for BNA's (EPA Method #625; KCEL #731).
Volatile Organics	Purge and trap method (EPA Method #624; KCEL #732).
Total Metals	ICP for Cd, Cr, Cu, Ni, Pb and Zn (EPA Method #200.7; KCEL #612v4); for Hg analysis (KCEL #604v5, 601v4, 605v0).

RESULTS

ACUTE TOXICITY TESTS

Daphnia pulex – 48-Hour Static Acute Test #8248

Survival results for the 48-hour *Daphnia* acute test #8248 with Echo Lake storm water samples are listed in the table below.

Sample #	Station	% Sample	Percent Survival at 48 Hours					# *Daphnia* Tested
			% Survival in each rep. (n=5 *Daphnia*/rep)					
			Rep 1	Rep 2	Rep 3	Rep 4	Mean	
----	Well Water Control	0	100	100	100	80	**95**	20
L66938-1	ECHO-BP1-IN	6.25	100	100	100	100	**100**	20
		12.5	100	100	100	100	**100**	20
		25	100	100	100	100	**100**	20
		50	100	100	100	100	**100**	20
		100	100	100	100	100	**100**	20
L66938-3	ECHO-BP1-OUT	6.25	100	100	100	100	**100**	20
		12.5	100	100	100	100	**100**	20
		25	100	100	100	100	**100**	20
		50	100	100	100	100	**100**	20
		100	100	100	100	100	**100**	20

Survival was 95% in the WW-only control and 100% in all concentrations of both Inlet and Outlet samples. Survival in both the 100% Inlet and Outlet samples did not differ significantly from the WW-only control ($p > 0.05$; Wilcoxon Rank Sum 2-Sample Test). The NOEC for survival was 100% for both samples ($p > 0.05$; Steels Many-One Rank Sum Test). An LC50 could not be calculated for either the Inlet or Outlet sample due to insufficient mortality.

The maximum un-ionized ammonia levels in the 100% storm samples during the 48-hour test are listed in the table below.

Station:	ECHO-BP1-IN	ECHO-BP1-OUT
KCEL Sample #:	L66938-1	L66938-3
NH_3-N (mg/L)	0.006	0.002

***Ceriodaphnia dubia* - 7-Day Chronic Static Renewal Test #8245**

Reproduction and survival results over the 7-day chronic *Ceriodaphnia* test #8245 with 100% Echo Lake storm water samples are shown in the table below. Reproduction was calculated using the 6-day data after 60% or greater of control organisms produced 3 or more broods (US EPA 2002b; WA DOE 2016).

Sample #	Station	% Sample	Reproduction (#Neonates/Adult in 6 Days)										Mean Reprod	Mean 7d % Surv
			1	2	3	4	5	6	7	8	9	10		
---	LWW Control (Low-Hardness)	0	30	30	31	30	30	33	33	34	29	30	**31.0**	100
---	LWW (unadjusted)	0	37	36	37	38	31	31	37	35	36	36	**35.4**	100
L66938-1	ECHO-BP1-IN	100	0	0	0	0	0	0	0	0	0	0	**0**	0
-3	ECHO-BP1-OUT	100	39	14[x]	40	42	43	33	40	37	45	46	**37.9***	90**

*Significantly greater than in Inlet sample ($p < 0.05$; Wilcoxon Rank Sum 2-Sample Test)
**Significantly greater than in Inlet sample ($p < 0.05$; Fisher Exact Test)
[x]Mortality on Day 6

As shown in the table above, survival was 90% in the Outlet sample and 100% in both the hardness-adjusted and non-adjusted LWW-only controls. Survival was 0% in the Inlet sample.

Reproduction in the Outlet sample was significantly greater than in the Inlet sample ($p < 0.05$; Wilcoxon Rank Sum 2-Sample Test).

The maximum un-ionized ammonia levels reached in the 100% storm samples during the 7-day chronic test are listed in the table below.

Station:	ECHO-BP1-IN	ECHO-BP1-OUT
KCEL Sample #:	L66938-1	L66938-3
NH_3-N (mg/L)	0.005	0.003

QUALITY CONTROL

Storm water sample and control performance results are summarized in the following table:

Test Organism:	*Ceriodaphnia*	*Daphnia*
Test #:	8245	8248
Control Survival (%)	100	95
Criteria	≥ 80	≥ 90
Acceptable?	**Yes**	**Yes**
Control Reproduction (# neos/adult)	31.0	
Criteria	≥ 15	
Acceptable?	**Yes**	

As shown in the table above, both the acute and chronic effluent tests met acceptability criteria regarding control performance, including survival and reproduction (US EPA, 2002a & 2002b).

Dissolved oxygen, pH, temperature and/or salinity remained within acceptable limits throughout both the acute and chronic tests (US EPA, 2002a & 2002b). Water quality data recorded during testing is shown on the photocopied pages from the laboratory notebook in the "Effluent Tests" section of this report.

Appendix G:
Data Quality Assessment

Contents:

Appendix G1:
Data Quality Summary

APPENDIX G1 – DATA QUALITY SUMMARY

This section summarizes the findings of the data quality assessment, which followed the steps outlined in Section 10.0 of the project Quality Assurance Project Plan (QAPP; King County 2015a). The data collected for this project were reviewed partway through data collection and again when the full dataset was available. This summary describes how well the data met the general project objectives and the specific data quality objectives, as well as any implications this may have on data usage. Finally, the section includes a brief summary of system-wide data quality for data that were obtained from other sources, but used for comparisons (i.e., 2010-11 outfall samples and lake monitoring data).

G1.1 General Project Objectives

Project objectives were achieved with a few exceptions, which are listed below (see Section 1.1 of the main report for a list of project objectives):

- The effectiveness of the retrofit for bacteria treatment could not be confidently determined due to data quality issues and impacted Objectives 1, 2, and 4. These data quality issues are described in the data validation memo included as Appendix G2. Some estimates of bacteria treatment effectiveness are presented in Appendix H.
- There were significant issues with the ability to collect flow data at the detention tank system (DTS) as described in Appendix I. These data were required to address the flow control portion of project objective #2. No estimates of flow control effectiveness are included in this report.
- To address Objective 1, the QAPP specified that six to eight storms would be sampled for each individual BMP; however only five storms were sampled for the Filterra® (i.e., FLT1) and only two storms were sampled at the bioretention planter box (BPB) installed in 2016 (i.e., BPB4). This data limitation resulted in lower statistical power to evaluate the Filterra treatment effectiveness. However, statistical differences were detected for many parameters, indicating sufficient statistical power to detect treatment effectiveness for most parameters. Representativeness may have been limited, however (See Section G1.6). Statistical tests could not be conducted for the limited BPB4 results without combining these data with other BPB results. Therefore, comparisons between new BPBs and older BPBs (i.e., BPB1, BPB2, and BPB3 – installed in 2012) could not be done for this study. While the QAPP specified a second Filterra would be evaluated by the study, this was not possible (See Appendix C).

G1.2 Precision

Precision is the agreement of a set of results among themselves and is a measure of the ability to reproduce a result. Precision was evaluated through analysis of field replicates, laboratory replicates and matrix spike duplicates according to the control limits specified in the QAPP.

- Section G2 describes a few instances where King County Environmental Laboratory (KCEL) quality control (QC) results were outside precision control limits specified in the QAPP. The associated sample results were qualified as estimates, but none of these results were rejected. Precision control limits were met for polychlorinated biphenyl (PCB) analysis.
- Table G1-1 lists the field replicate samples collected for the project. The total number of field replicates exceeded the number specified in the QAPP, but more replicates were collected from the influent than effluent, due to limited effluent flow during the sampling period. The relative percent differences (RPDs) between primary and replicate sample results were within the control limits used for laboratory replicates for all but a handful of results (Table G1-2).

Table G1-1. Collection and analysis of field replicate samples.

Site/ Flow	Collect Date	Sample IDs*	Field Meas.	TSS	Total Nutrients & Metals	Dis. Nutr.	Dis. Metals	PAH	TPH-Dx	PCB
BPB1 Influent	01/21/16	L64648-1 (-2) **L64648-9 (-10)**		✓	✓	✓		✓	✓	✓
BPB1 Influent	10/26/16	L66498-1 (-2) **L66498-22 (-23)**	✓	X	X	✓	✓	✓	✓

*Replicate sample IDs in bold. Grab sample IDs in parentheses.
✓ - all results were within laboratory replicate control limits
X – some results were outside laboratory replicate control limits (Table G1-2).
TSS – total suspended solids; Dis. Nutr. – dissolved nutrients; PAH – polycyclic aromatic hydrocarbons; TPH-Dx – total lube oil-/diesel-range hydrocarbons, PCB – polychlorinated biphenyls

Table G1-2. Results for field replicate samples that exceeded control limits.

Parameter	Control Limits	Field Replicate Results Outside Control Limits (RPD)
Turbidity	20%	L67070-26 (38%) L66175-5 (57%)
Conductivity	10%	L66175-5 (43%)
TSS	25%	L66498-22 (28%) L67070-26 (28%)
Total Phosphorus	20%	L66938-22 (21%)
Lead	20%	L66498-22 (24%) L66938-22 (29%)
Total PCBs	50%	L64999-17 (180%)

Comparison of field replicate results to laboratory replicate control limits is a conservative measure of precision, and these slight variations do not indicate severe precision issues; however, the relatively greater difference between PCB results was investigated further.

Total PCBs are calculated as the sum of all detected congeners, and individual congener concentrations were compared to further explore differences in this sample pair. Only one congener (PCB-118, 5.9 pg/L) was detected in the primary sample (L64999-7). Detection of such a low concentration is extremely unusual for an environmental sample. Nineteen congeners (114 pg/L total PCBs) were detected in the field replicate (L64999-17) which represents a more typical pattern. PCB-118 was detected at very similar concentrations (5.9 and 5.4 pg/L) and was the only congener in common between the samples. There was no indication that the other 18 congeners were present in the primary sample (e.g., no blank corrected or qualified results). However, almost all detections in these samples were below the estimated quantitation limit (EQL) and were flagged as estimates by the laboratory.

Coincidentally, a laboratory duplicate analysis was performed on this field replicate. Total PCBs in the laboratory duplicate were very similar to the field replicate at 112 pg/L, and the congener profiles were virtually identical. This indicates acceptable laboratory precision, suggesting that the difference between the primary sample and field replicate is due to variability introduced during field collection. Overall, these total PCB concentrations are quite low and as a result, a slight difference in collected material can result in seemingly high variability. The project objectives were still addressed, because differences between influent and effluent PCB concentrations at the BPBs and Filterra were generally much greater than this low level variability.

G1.3 Bias

Bias is a measure of the difference, due to a systematic factor, between an analytical result and the true value of an analyte. This was evaluated through analysis of equipment blanks, method blanks, spike blanks, matrix spikes, certified reference materials, laboratory control samples and/or surrogates, along with laboratory recovery sample control charts.

- No systematic bias was observed in the KCEL analysis based on method blanks and spiked QC samples, but there were a few isolated instances of bias. These instances are described in the data validation memo, and some sample results were qualified as estimates with high or low bias. The severity of bias was low and did not indicate results should be rejected.
- Method blank contamination is an expected issue for PCB congener analysis due to the ubiquitous nature of PCBs and the low detection limits required for the analysis. Total PCB concentrations in all method blanks were less than 200 pg/L, and all congeners detected within five times the concentration in the associated blank were qualified as non-detects during the data validation process. Congener PCB-11 was the most common and influential contaminant in the method blanks.
- As detailed in Section G3, one laboratory control sample for PCB analysis indicated high bias for two congeners. This resulted in the need to flag some sample results as estimates in the data validation process, but no results were rejected.
- One equipment blank for the DTS sampling set-up (i.e., autosampler) was analyzed for nutrients, conventional parameters, metals, and PAHs. Concentrations of all parameters were below detection limits, except TOC at 0.71 mg/L. All TOC results at the DTS were at least 8 mg/L, so this slight high bias suggested by the equipment blank is not expected to negatively impact the results.
- Three equipment blanks were analyzed for PCB congeners. These represented the set-up for DTS sampling, the BPB/Filterra influent sampling, and BPB effluent sampling. Total PCB concentrations were less than 50 pg/L in each sample. About 20% of the total concentration in each was contributed by PCB-68, and between 33% and 49% by PCB-75. With similar results in each equipment blank, this slight high bias is not likely to impact the project objectives of comparing between influent and effluent concentrations.

G1.4 Sensitivity

Sensitivity is a measure of the capability of analytical methods to meet the study goal. Detection limits were appropriate to assess differences between influent and effluent concentrations for almost all parameters. There was excellent frequency of detection (FOD) for TSS, nutrients, metals (except cadmium and dissolved lead), total PCBs, and influent PAHs and lube oil-range hydrocarbons. For parameters with less than 100% FOD, the FOD was generally much lower in effluent samples, indicating decreasing concentrations through treatment, despite the non-detects. The exceptions were dissolved cadmium and diesel-range hydrocarbons for which there were only a handful of detections, and dissolved

lead where detections were all below the reporting detection limit (RDL). Overall, sensitivity was sufficient to address the project objectives with these few exceptions.

G1.5 Accuracy

Accuracy is an estimate of the difference between the true value and the measured value. The accuracy of a result is affected by both systematic and random errors. Accuracy of the analytical results was evaluated using matrix spikes, certified reference materials and/or laboratory control samples, and ongoing recovery sample control charts. Equipment blanks, method blanks, spiked QC samples, and laboratory control samples can also impact accuracy, but these are discussed under bias (Section G1.3). Accuracy of the field measurements were assessed by check standards and end checks, which were all within control limits. Flow data were not used for any analysis, and so accuracy was not rigorously assessed.

G1.6 Representativeness

Representativeness expresses the degree to which sample data accurately and precisely represent a characteristic of a population, parameter variations at the sampling point, or an environmental condition. Sample collection followed the established sample handling and holding times required for each analytical test, with a few exceptions (orthophosphate phosphorus, bacteria, and, at the DTS, dissolved metals; Section G2). The equipment blank results demonstrate that equipment decontamination methods were successful.

Representativeness may have been limited by the number of sample pairs available to assess effectiveness at each BMP ($n \leq 8$). A greater number of samples collected over more diverse conditions would allow for greater certainty that the sample results were representative of average effectiveness; however, the project was constrained by the planned scope and budget. Additionally, storm samples often did not capture the first pulse of a given storm event (Appendix H4).

The DTS inlet sampling location does not represent all of the stormwater entering the DTS; one small subbasin enters from a different inlet. This was not expected to significantly impact comparisons between influent and effluent water quality, as described in the QAPP (King County 2015a). Additionally, the DTS outlet sampling location does not represent all stormwater discharged to Echo Lake through the main outfall; one small subbasin enters the stormwater line downstream of the DTS outlet sampling location.

One sample (L65650-1) from the DTS inlet was collected during a relatively small storm on 6/23/2016 and considered non- representative of influent conditions. The autosampler recorded collection of sample aliquots at this location prior to the beginning of the rain event. This suggests that some sample aliquots were collected from water that remained in the catch basin from a previous storm event. The field lead agreed that it was possible the sample line had been placed too low, so that the line may have been submerged in this

water. The project team decided to exclude this sample pair from the data analysis, because it was not likely representative of the influent to the DTS during that storm event.

G1.7 Comparability

Comparability is a qualitative parameter expressing the confidence with which one data set can be compared with another. Standard collection and analysis methods were followed throughout the project to assure comparability of project data. The QAPP describes how the stormwater treatment evaluated for this project can be compared to stormwater treatment throughout the region (King County 2015a); the DTS was designed according to recommendations in the 2005 SWMMWW (Ecology 2005).

The QAPP also describes comparability issues between pre-retrofit outfall sample results and post-retrofit DTS sample results due to stormwater system configurations, development, and sample collection during slightly different times of year. Statistical comparisons are not presented in this report due to the high uncertainty in comparability. These issues are described further in Section 2.2 (Objective 3) of the main report and Appendix A.

G1.8 Completeness

Completeness is defined as the total number of samples analyzed for which acceptable analytical data are generated, compared to the total number of samples submitted for analysis. The QAPP specified a goal of six samples per sampling location and 90% acceptable analytical data. These data quality goals were met, with the exception of the Filterra and BPB4 where less than six samples were collected. Project objectives were still met for the Filterra, but treatment effectiveness could not be statistically assessed at BPB4 due to limited sample numbers (Section G1.1). Flow monitoring was not completed for this project, as described in Appendix I.

G1.9 Quality of System-wide Data Collected Outside this Project

Data collected outside this project were not validated, but basic data quality was reviewed, as described below. No data were rejected based on this review.

Outfall Samples (2010-2011)
Results from the pre-retrofit samples collected at the outfall to Echo Lake were reviewed for any data quality issues following the same data quality guidelines required for project data (see QAPP; King County 2015a). No formal data validation memo was produced, but the batch and QC reports were reviewed and are available upon request.

Dissolved metals and dissolved nutrients samples were not filtered within the prescribed 15-minute holding time, and two total suspended solids samples were not analyzed within the prescribed seven-day holding time. These data quality issues cast some uncertainty on

these pre-retrofit results, but the data were not rejected. All other data quality objectives were met.

Echo Lake Monitoring Data

A technical memorandum describes the data quality assessment for Echo Lake monitoring data collected from 2001 through 2011 (King County 2015b). The nutrient data collected from 2012 to 2016 were reviewed through the King County Small Lakes Monitoring Program. This process includes a screen for outliers based on historical data and a consult with the KCEL to identify any quality control issues. The data review process also identified three samples that were analyzed for phosphorus outside the 7-day holding time. These results were flagged as estimates. Additionally, one fecal coliform sample result was not reported due to a power outage at the laboratory. No other quality control issues were reported for the data used in the analyses presented in Appendix H.

RE: Data Validation Memo: Echo Lake Stormwater Monitoring – SAM Effectiveness Study

This technical memorandum summarizes the data validation review performed on 137 stormwater samples collected within the Echo Lake drainage basin in Shoreline, WA between December 8,2015 and February 15, 2017. Also included are results from equipment blanks: one autosampler blank sample and 12 filter blank samples from processing for dissolved nutrient analysis. The equipment blank samples were collected between June 24, 2016 and March 29, 2017. The sample collection and analysis methods are specified in the project Quality Assurance Project Plan (QAPP; King County 2015). Samples were analyzed for one or more of the following: field measurements (i.e., conductivity, dissolved oxygen, pH, temperature, and turbidity), total suspended solids (TSS), total and dissolved nutrients, total and dissolved organic carbon (TOC/DOC), bacteria, total and dissolved trace metals, petroleum hydrocarbons (Dx), and polycyclic aromatic hydrocarbons (PAHs). A few samples were also analyzed for total alkalinity, as a requirement of the EPA toxicity methods. The alkalinity results are not included in this data validation effort. Table 1-1 provides an inventory of the samples included in this data validation review. All samples were collected and analyzed by the King County Environmental Laboratory (KCEL).

1.0 INTRODUCTION

This data validation review was based, in part, on guidance in *USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (EPA 2016a) and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review* (EPA 2016b), as well as the project QAPP (King County 2015). Materials reviewed included Batch Reports and Analytical Quality Control (QC) Reports downloaded from the King County Laboratory Information Management System (LIMS) database and are included in this memorandum as Attachment A. Also reviewed were data anomaly forms (DAF), which are available upon request. The QC parameters reviewed during this data validation include: holding time, method blanks, spike blanks, laboratory control samples, matrix spikes, matrix spike duplicates, laboratory duplicates, and surrogates, all of which are described below. Field measurements and microbiology analyses include unique QC measurements and QC samples, which are described in Sections 1.10 and 1.11.

1.1. Holding Time (HT)

The analytical HT is a method-specific timeframe, during which sample preparation and analysis should occur to provide valid data. All samples should be analyzed within this prescribed HT. For composite samples, the end of the composite period is considered the start of the HT period.

1.2. Method Blank (MB)

A MB is an aliquot of clean reference matrix that is typically processed through the entire analytical procedure. The MB is used to evaluate the levels of contamination that might be associated with the processing and analysis of samples. All MB results should be less than method detection limits (MDLs).

1.3. Spike Blank (SB)

A SB is an aliquot of the clean reference matrix used for the MB, to which a known concentration of target analyte(s) has been added. The SB is processed through the entire analytical procedure, and used as an indicator of method accuracy. SBs are not addressed in the *National Functional Guidelines*; however, King County has empirically-derived control limits for SB analytes, which are shown on the attached QC reports. SB results should be within these control limits.

1.4. Spike Blank Duplicate (SBD)

A SBD is a second aliquot of the clean reference matrix used for the MB, to which a known concentration of target analyte(s) has been added. The SBD is used as an additional indicator of method accuracy as well as an indicator of method precision. The relative percent difference (RPD) between SB and SBD results should be within QAPP-specified control limits.

1.5. Matrix Spike (MS)

A MS is a sample aliquot fortified with a known concentration of a target analyte(s). The MS is processed through the entire analytical procedure. The MS is used as an indicator of sample

matrix effect on the recovery of target analyte(s). The *National Functional Guidelines* specifies control limits of 75% to 125% MS recoveries for trace metals (EPA 2016b). For all other analytes, King County has empirically-derived control limits, which are shown on the attached QC reports. MS recoveries should be within these control limits.

1.6. Matrix Spike Duplicate (MSD)

A MSD is a second sample aliquot fortified with a known concentration of a target analyte(s). The MSD is used as an additional indicator of sample matrix effect on the recovery of target analyte(s) as well as an indicator of method precision. The relative percent difference (RPD) between MS and MSD results should be within QAPP-specified control limits.

1.7. Laboratory Control Sample (LCS)

A LCS is a sample of known analyte concentration(s) that is prepared in the lab from a separate source of analyte(s) relative to the calibration standards. The LCS analysis follows the entire analytical process and is stored and prepared following the same procedures as a field sample. The LCS is used as an indicator of method accuracy and long-term analytical precision. King County uses QAPP-specified percent recovery control limits, which are shown on the attached QC reports. Percent recoveries for LCS results should be within these control limits.

1.8. Laboratory Duplicate (LD)

A LD is a second aliquot of a sample, processed concurrently and in an identical manner with the original sample. The LD is used as an indicator of method precision and laboratory subsampling procedures. The LD can also be used to provide information regarding the homogeneity of the sample matrix. QC results are reported as an RPD between the sample and LD results. The RPD between all trace metal LD results should be within 20% (EPA 2016b). QAPP-specified control limits are used for all other analytes. LD RPD results will not be qualified for samples in which the concentration is less than the reporting detection limit (RDL), because of the inherent analytical variability at concentrations less than the RDL, which is the limit of practical quantitation.

1.9. Surrogates

A surrogate is a known concentration of non-target analyte which is added to each sample (both analytical and QC samples) prior to extraction and analysis for all trace organic analyses. Surrogate recovery is used as a sample-specific indication of method or matrix bias for target analytes. The surrogate is selected to behave in a similar manner to the target analytes. All surrogates and their control limits are listed in the QC report in Appendix A.

1.10. Field Measurement-Specific QC Measurements

A check standard (CS) is a solution of known concentration that is prepared independently from calibration standard solutions. It is analyzed after initial calibration, but prior to field measurements and also following the last measurement (i.e., end check [EC]) to check accuracy and stability of the detector.

A field measurement replicate (FREP) is defined as a separate in-situ measurement made following all procedures typically done between individual measurements. The probe would typically be maintained at the same depth and position used in the original measurement. FREPs are generally performed at a minimum frequency of 5% of measurements or once per day.

Field measurement duplicates are defined as two sequential measurements made on a portion of the sample collected in a bucket or other container. The intent of taking measurements from water collected in a separate container is to eliminate or minimize any variability in the measured water due to current or other changing conditions.

1.11. Microbiology-Specific QC Samples

A negative control sample is media streaked with a non-target organism and analyzed through the complete procedure. The negative control is expected to show no detectable target organisms thereby evaluating the specificity of the method.

A positive control is a QC sample prepared or obtained by the lab which is known or expected to yield a positive response. A positive control can be either a sample of contaminated water or media streaked with the target organism, which is analyzed through the complete procedure.

A “before membrane filtration blank” is an aliquot of sterile diluent added to challenge the testing apparatus and conditions prior to membrane filtration of samples. The before filtration blank is analyzed to evaluate the sterility of the materials, equipment and work area at the beginning of sample analysis.

An “after membrane filtration blank” is an aliquot of sterile diluent added to challenge the testing apparatus and conditions after membrane filtration of samples. The after filtration blank is analyzed to evaluate cross-contamination during sample analysis.

1.12. Validation Reporting

The following sections describe the data validation actions for each analyte group. This includes a table listing the HT and QC samples reviewed during the validation in each workgroup, a description of each result outside control limits, and the recommended actions for data validation. Any additional data quality issues are also discussed. Table A at the end of this memorandum lists all recommended validation qualifiers based on this review.

2.0 FIELD MEASUREMENTS

Field measurements included conductivity, dissolved oxygen, pH, temperature, and turbidity. An aliquot of sample was used to measure these parameters in the field. An EXO YSI Sonde was used for all measurements except turbidity, for which a Hach 2100 Portable Turbidimeter was generally used.

The following sections summarize the QC measurements for each parameter. Please note some workgroup numbers are repeated across parameters, because they are measured concurrently with the equipment.

2.1. Conductivity

Conductivity was measured using KCEL Standard Operating Procedure (SOP) #206v2 for 69 samples batched as 11 workgroups. CS and EC were included for each workgroup. The QAPP specified that field measurement duplicates and FREPs would be measured once per sampling event, but this was not done. The KCEL discontinued the practice of measuring duplicates, and FREPs were only measured when environmental sample FREPs were collected. Workgroups without FREPs do not include an evaluation of precision and the associated sample results should be qualified with "J" flags and considered estimates with unknown bias. QC results are summarized in Table 2-1 and Section 2.1.1. Table A lists all recommended data qualifications.

Table 2-1. Conductivity Workgroups and QC Measurements

Workgroup	Samples	FREP	CS/EC

	Control Limits:	10% RPD	90-110% Recovery

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup

2.1.1. Results Outside Control Limits

Workgroup WG148805 included an FREP, but the RPD between results was 12.01%, exceeding the 10% RPD specified in the QAPP. This indicates unacceptable precision in conductivity measurements for this workgroup. Associated sample results should be qualified with "J" flags and considered estimates with unknown bias.

2.2. Dissolved Oxygen

Dissolved oxygen was measured using KCEL SOP #201v3 for 69 samples batched as 11 workgroups. EC were included for each workgroup. The QAPP specified that field measurement duplicates and FREPs would be measured once per sampling event, but this was not done. The KCEL discontinued the practice of measuring duplicates, and FREPs were only measured when environmental sample FREPs were collected. Workgroups without FREPs do not include any

evaluation of precision and the associated sample results should be qualified with "J" flags and considered estimates with unknown bias. All QC measurement results were within control limits, indicating acceptable data quality, except as described above (Table 2-2). Table A lists all recommended data qualifications.

Table 2-2. Dissolved Oxygen Workgroups and QC Measurements

Workgroup	Samples	FREP	EC

2.3. pH

pH was measured using KCEL SOP #202v3 for 69 samples batched as 11 workgroups. CS and EC were included for each workgroup. The QAPP specified that field measurement duplicates and FREPs would be measured once per sampling event, but this was not done. The KCEL discontinued the practice of measuring duplicates, and FREPs were only measured when environmental sample FREPs were collected. Workgroups without FREPs do not include any evaluation of precision and the associated sample results should be qualified with "J" flags and considered estimates with unknown bias. All QC measurement results were within control limits, indicating acceptable data quality, except as described above (Table 2-3). Table A lists all recommended data qualifications.

2.4. Temperature

Temperature was measured using KCEL SOP #203v3 for 69 samples batched as 11 workgroups. The QAPP specified that field measurement duplicates and FREPs would be measured once per sampling event, but this was not done. The KCEL discontinued the practice of measuring duplicates, and FREPs were only measured when environmental sample FREPs were collected. Workgroups without FREPs do not include any evaluation of precision and the associated sample results should be qualified with "J" flags and considered estimates with unknown bias. All QC measurement results were within control limits, indicating acceptable data quality, except as described above (Table 2-4). Table A lists all recommended data qualifications.

	Control Limits:	±0.3°C Difference

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup

2.5. Turbidity

Turbidity was measured using KCEL SOP #207v1 for 70 samples batched as 11 workgroups. CS and EC were included for each workgroup. The QAPP specified that field measurement duplicates and FREPs would be measured once per sampling event, but this was not done. The KCEL discontinued the practice of measuring duplicates, and FREPs were only measured when environmental sample FREPs were collected. Workgroups without FREPs do not include any evaluation of precision and the associated sample results should be qualified with "J" flags and considered estimates with unknown bias. QC results are summarized in Table 2-5 and Section 2.5.1. Table A lists all recommended data qualifications.

Table 2-5. Turbidity Workgroups and QC Measurements

Workgroup	Samples	FREP	CS/EC
WG143803	L64379-2, -4, -6, and -8	NA	✓
WG144380	L64648-1, -3, -5, and -7	NA	✓
WG144920	L64921-1, -3, -5, -7, -9, -11, and -15	NA	✓

WG149919	L66938-1, -3, -5, -7, -9, -11, -13, -15, -17, -19, and -22	NA	✓
WG150448	L67070-1, -3, -5, -7, -9, -11, and -26	X	✓
WG150454	L67140-1, -3, -5, and -7	NA	✓
	Control Limits:	20% RPD	±20% of true value

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup

2.5.1. Results Outside Control Limits

Workgroup WG150448 included an FREP, but the RPD between results was 38% exceeding the QAPP specified 20% RPD. This indicates unacceptable precision in turbidity for this workgroup. Associated sample results should be qualified with "J" flags and considered estimates with unknown bias.

3.0 CONVENTIONAL PARAMETERS AND NUTRIENTS

Conventional parameters included TSS, and, for some samples, TOC/DOC. Nutrients included total and dissolved nitrogen and phosphorus.

3.1. TSS

TSS was analyzed following Standard Method SM2540-D (APHA 1998) for 76 samples batched as 13 workgroups (Table 3-1). The QAPP specified each workgroup should include analysis of three QC sample-types: MB, LCS, and LD. Results indicate acceptable data quality for all project samples (Table 3-1 and Section 3.1.1).

Table 3-1. TSS Workgroups and QC Assessment

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup

3.1.1. Results Outside Control Limits

Workgroup WG146466 included two LDs. One was performed on a leachate matrix sample, and had an RPD of 54%, which exceeded control limits. However, the other LD had an RPD of 0% and was performed on a sample matrix similar to the project samples (i.e., stormwater) indicating acceptable precision for project sample results.

3.2. Total and Dissolved Organic Carbon

TOC and DOC were analyzed following Standard Method SM5310-B (APHA 1998), which is a high-temperature combustion/infrared detection method. Samples were batched as 15 workgroups (34 samples for DOC and 11 samples for TOC; Table 3-2). Each workgroup included analysis of five QC sample-types: MB, SB, LCS, MS, and LD. Results indicate acceptable data quality for all project samples (Table 3-2).

Table 3-2. TOC/DOC Workgroups and QC Samples

3.3. Total Nitrogen and Phosphorus

Total nitrogen and total phosphorus were analyzed following Standard Methods SM4500-N-C and SM4500-P-B,F (APHA 1998), respectively, for 76 samples batched as 12 workgroups (Table 3-3). The QAPP specified each workgroup should include analysis of five QC sample-types for each analyte: MB, SB, MS, LCS, and LD. Results indicate acceptable data quality for all project samples (Table 3-3 and Section 3.3.1).

Table 3-3. Total Nitrogen and Total Phosphorus Workgroups and QC Assessment

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup

3.3.1. Results Outside Control Limits

Workgroup WG147783 included five LDs for total phosphorus. One LD was performed on a freshwater matrix sample and had a 22% RPD, exceeding control limits. All other LDs had RPDs within control limits, including one performed on a project sample, indicating acceptable precision for project sample results.

3.4. Ammonia Nitrogen

Nitrogen was analyzed as ammonia following Kerouel & Aminot (1997) for 89 samples batched as 15 workgroups (Table 3-4). The QAPP specified each workgroup should include analysis of five QC sample-types for each analyte: MB, SB, MS, LCS, and LD. Results indicate acceptable data quality for all project samples (Table 3-4).

Table 3-4. Ammonia Nitrogen Workgroups and QC Assessment

3.5. Nitrite/nitrate and Orthophosphate

Nitrogen was analyzed as nitrite/nitrate and phosphorus as orthophosphate following Standard Methods SM4500-NO3-F and SM4500-P-F (APHA 1998), respectively, for 89 samples batched as 15 workgroups (Table 3-5). The QAPP specified each workgroup should include analysis of five QC sample-types for each analyte: MB, SB, MS, LCS, and LD. Results for HT and QC samples were within control limits (Table 3-5); however, sample handling issues impacted orthophosphate phosphorus results (Section 3.5.1). Table A lists all recommended data qualifications.

Table 3-5. Nitrate/nitrite and Orthophosphate Workgroups and QC Assessment

3.5.1. Sampling Handling Issue

All orthophosphate phosphorus samples were filtered outside of the method-specified 15-minute HT. All detected results should be qualified with "J" flags and considered estimates with unknown bias. All non-detect results should be qualified with "UJ" flags and considered estimated non-detects with unknown bias.

4.0 TRACE METALS

Trace metals analysis included total and dissolved cadmium, copper, lead, zinc, total magnesium and calcium, and hardness as $CaCO_3$.

4.1. Total ICP-MS Metals and Hardness

Total metals were analyzed by inductively coupled plasma mass spectroscopy (ICP-MS) following EPA Method 200.8 (EPA 1995) for 77 samples batched as 11 workgroups (Table 4-1). The QAPP specified that each workgroup include four QC sample-types: MB, SB, MS, and LD. Results indicate acceptable data quality for all project samples (Table 4-1).

Table 4-1. Total ICP-MS and Hardness Workgroups and QC Samples

WG151216	L67413-1	✓	✓	✓	✓	✓
	Control Limits:	180 days	<MDL	85-115% Recovery	75-125% Recovery	20% RPD

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup

* At least one project parameter measured in the MS in these workgroups had a spiked concentration that was less than four times the concentration detected in the sample on which the MS was performed. This violates the "4x rule" and accuracy cannot be assessed due to the low spike to sample concentration ratio. However, recoveries for these MS results were still within control limits and SBs can also be used to assess method accuracy. No qualifications are recommended based on MS results.

4.2. Dissolved ICP-MS Metals

Dissolved metals were analyzed by inductively coupled plasma mass spectroscopy (ICP-MS) following EPA Method 200.8 (EPA 1995) for 76 samples batched as 16 workgroups (Table 4-2). The QAPP specified that each workgroup include four QC sample-types: MB, SB, MS, and LD. The results indicate acceptable data quality for all project samples (Table 4-2), with the exception of a few sample handling issues (Section 4.2.1). Table A lists all recommended data qualifications.

Table 4-2. Dissolved ICP-MS Workgroups and QC Samples

WG151091	L67413-1	✓	✓	✓	✓	✓
	Control Limits:	180 days	<MDL	85-115% Recovery	75-125% Recovery	20% RPD

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup

* The spiked concentration of dissolved zinc in the MS in this workgroup was less than four times the concentration detected in the sample on which the MS was performed. This violates the "4x rule" and accuracy cannot be assessed due to the low spike to sample concentration ratio. However, recoveries for these MS results were still within control limits and SBs can also be used to assess method accuracy. No qualifications are recommended based on MS results.

4.2.1. Sampling Handling Issue

Composite samples collected with the autosampler (L65650-1 and -3; L66175-1 and -3; L66285-1 and -3; L66384-1 and -3; L66435-1 and -3; L66499-1 and -3) were filtered for dissolved metals analysis outside the 15-minute hold time. Detected dissolved metals results for these samples should be qualified with "J" flags and considered estimates with unknown bias and non-detect results should be qualified with "UJ" flags and considered estimated non-detects with unknown bias.

5.0 TRACE ORGANICS

The QAPP specified trace organics would include analysis of PAHs and petroleum hydrocarbons.

5.1. PAHs

PAHs were analyzed by SW846-8270D-SIM for 72 samples batched as 13 workgroups (Table 5-1). Ideally, the QC samples for each workgroup would include MB, SB, MS, and MSD; however, the QAPP specified that SBDs could be substituted for MSDs when sample volume was limited. MSDs were not analyzed in four workgroups, but SB/SBD results can be used to assess method precision. Surrogates are also used in each QC and environmental sample. Results are summarized in Table 5-1 and indicate acceptable data quality for all project samples, with the exceptions described below (Section 5.1.1). Table A lists all recommended data qualifications.

Table 5-1. PAH Workgroups and QC Samples

Control Limits:		7/40 days*	<MDL	Variable†	40% RPD	Variable†	40% RPD	Variable†

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup; * – extracted within 7 days, analyzed within subsequent 40 days; † - Control limits vary by compound; see attached QC report.

5.1.1. Results Outside Control Limits

In the MB for workgroup WG144921, naphthalene was detected at a concentration within five times of all naphthalene detections in samples associated with this workgroup. The detected results were all less than RDL and should be qualified with "U" flags and considered nondetects with the RDL value as the level of detection.

In the SB and SBD associated with workgroup WG148302, fluorene recoveries (53% and 51%) were just below the lower control limit (54%), suggesting potentially low bias for associated sample results. No other accuracy issues were identified for fluorene in this workgroup, and the MS was conducted on a project sample. Fluorene was not detected in the samples associated with this workgroup or in any other samples collected at these sampling locations (ECHO-DTS-IN and ECHO-DTS-OUT). This suggests the sample results are consistent with results in other workgroups. No qualifications are recommended for fluorene in this workgroup based on this analysis.

In the MS associated with workgroup WG148302, indeno(1,2,3-Cd)pyrene recovery (139%) exceeded the upper control limit (130%), suggesting potentially high bias for associated sample results. Results for indeno(1,2,3-Cd)pyrene in the SB and SBD associated with this workgroup were within control limits, suggesting there was no systematic bias. Indeno(1,2,3-Cd)pyrene was not detected in the sample on which the MS was performed and so the result can be used without qualifications.

In the SB, MS and MSD associated with workgroup WG148652, recoveries for chrysene and benzo(b,j,k)fluoranthene exceeded the upper control limits, suggesting systematic high bias. Chrysene and benzo(b,j,k)fluoranthene were detected in both samples associated with this workgroup (L66435-1 and -3), and results should be qualified with "J" flags and considered estimates with high bias.

In the SB and MS associated with workgroup WG148678, recoveries for chrysene exceeded the upper control limits, suggesting systematic high bias in this workgroup. All detected chrysene results in this workgroup should be qualified with "J" flags and considered estimates with high bias.

In the MS associated with workgroup WG148678, recovery for indeno(1,2,3-Cd)pyrene (139%) exceeded the upper control limit (130%). Indeno(1,2,3-Cd)pyrene recovery in the MSD was within control limits (126%), and the RPD was within the 40% control limit. The SB recovery for indeno(1,2,3-Cd)pyrene was also within control limits suggesting there was no systematic bias for this workgroup, but there could be matrix interference that caused the high bias in the MS. The indeno(1,2,3-Cd)pyrene MS sample result (L66499-3) should be qualified with a "J" flag and considered an estimate with high bias.

Recoveries for the MS and MSD for acenaphthylene (both 45%) in workgroup WG151046 were below the lower control limit (51%). The MS and MSDs for this workgroup were performed on a sample with a very different matrix (stormwater) than

the project sample associated with this workgroup (L67413-1, an equipment blank). However, recoveries of surrogate, 2-fluorobiphenyl, were also below the lower control limit in six environmental samples, including the sample on which the MS was performed and the project sample (L67413-1). This surrogate represents lower molecular weight PAHs, like acenaphthylene. These QC results indicate potential low bias for acenaphthylene in these samples. Acenaphthylene was not detected in the project sample (L67413-1), and so this result should be qualified with a "UJ" flag and considered an estimated non-detect with low bias.

5.2. Petroleum Hydrocarbons

Petroleum hydrocarbons were analyzed by NWTPH-Dx (GC/FID) (Ecology 1997) for 59 samples batched as 10 workgroups (Table 5-2). Ideally, the QC samples for each workgroup would include MB, SB, and LD; however, the QAPP specified that SBDs could be substituted for LDs when sample volume was limited. LDs were not analyzed in two workgroups, but SBD results can be used to assess method precision. Surrogates are also used in each QC and environmental sample. Results indicate acceptable data quality for all project samples (Table 5-2 and Section 5.2.1).

Table 5-2. Petroleum Hydrocarbon Workgroups and QC Samples

Workgroup	Samples	HT	MB	SB	SBD	LD	Surrogates
WG143425	L64379-1 and -3	✓	✓	✓	NA	✓	X
WG144205	L64648-2, -4, -6, -8, and -10	✓	✓	✓	NA	✓	✓

WG150368	L67140-2, -4, -6, and -8	✓	✓	✓	✓	NA	✓
Control Limits:		7/40 days*	<MDL	50-150% Recovery	40% RPD	40% RPD	50-150% Recovery

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup
* – extracted within 7 days, analyzed within subsequent 40 days

5.2.1. Results Outside Control Limits

The recovery for surrogate, 2-fluorobiphenyl in workgroup WG143425, was below the lower control limit in the MB. It is not uncommon for MB surrogates to have somewhat depressed recoveries, due to the lack of matrix. Additionally, this surrogate is associated more with lower molecular weight hydrocarbons, like those included in the diesel-range hydrocarbon results. Even if the MB result was biased low, diesel range hydrocarbons

were not detected in the project samples associated with this workgroup, so there is no concern with laboratory contamination influencing the sample results. The sample results can be used without qualification.

6.0 MICROBIOLOGY

The QAPP specified samples would be analyzed for fecal coliform following Standard Method SM9222D; however, interferences were observed for all project samples, obscuring clear colony counts (Section 6.1). To address this issue, samples were analyzed for *Escherichia coli* (*E. coli*) instead of fecal coliform starting October 13, 2016. Table 6-1 lists the workgroups for the 72 samples that were analyzed for bacteria. The QAPP-specified the microbiology QC samples should include a negative and positive control sample (NC/PC) and before and after filtration blanks (BF/AF). Five workgroups also included a LD, which was not specified in the QAPP. QC samples are run for each workgroup or for all samples received over a four-hour period. Therefore, QC samples can be used to evaluate more than one workgroup if received within a four-hour period. Results are summarized in Table 6-1. Due to interferences (Section 6.1) and sample handling issues (Section 6.2), microbiology results for most project samples should be qualified with "J" flags and considered estimates with unknown bias. Table A lists all recommended data qualifications.

Table 6-1. Microbiology Workgroups and QC Samples

Workgroup	Samples	Analysis	HT	PC	NC	BF	AF	LD

WG150278	L67140-1, -3, -5, and -7	*E. coli*	✓	✓	✓	✓	✓	NA
WG154875	L66382-9, 11, 17, and 19	*E. coli*	✓	✓	✓	✓	✓	NA
Control Limits:			24 hours	Pass	Pass	<MDL, Pass	<MDL, Pass	*

✓ – meets control limits; X – outside control limits; NA – not analyzed in the workgroup

* The LD assessment is based on precision calculations with at least 15 LDs in a project. Only five LDs were included in this project, so precision could not be confidently assessed using LDs. However, LD results were comparable to previous stormwater projects, suggesting acceptable precision.

6.1. Interferences

As discussed above, the QAPP specified fecal coliform would be analyzed for each sample. However, an unknown matrix interference consistently caused abnormal colony growths in the media that were difficult to interpret. Following the first three sampling events, KCEL initiated analysis of *E. coli* plates in parallel with fecal coliform. The *E. coli* plates did not show interference and provided comparable results to the fecal coliform plates; therefore, only *E. coli* was analyzed for the remainder of the project. All fecal coliform results should be qualified with "J" flags and considered estimates with unknown bias. The results should not be rejected since the *E. coli* results confirmed the fecal coliform analysis provided reasonable estimates.

6.2. Sample Handling Issues

Due to the nature of the sampling locations and project, most microbiology samples were collected as composites. These methods introduce uncertainty through potential contamination from non-sterile equipment or from longer timespans allowing predation, die-off, or growth to occur. The microbiology results are not defensible for regulation and do not meet EPA standards due to these uncertainties. However, the timespans were relatively short (around two hours), minimizing these uncertainties. All composite sample microbiology results should be qualified with "J" flags and considered estimates with unknown bias.

7.0 DATA USABILITY

As a general data reporting format, sample results reported as "<MDL" should be assigned "U" flags and results reported as "<RDL" should be qualified with "J" flags and considered estimates with unknown bias. All other analytical results included in this dataset may be used as reported, without qualification, with the exceptions summarized in the previous sections and Table A below. LIMS Batch and QC reports are provided as Attachment A.

==========

If the following parameters are reported, values in the RPD column are actually Absolute Differences:

- pH, Field
- Salinity, Field
- Sample Depth
- Sample Temperature, Field

4xRule indicates no MS/MSD recovery was calculated due to the 4x rule.

SUBJECT: LDW Shoreline-Echo Lake SW Eff Monitoring, Data Validation

Dear Mr. Grothkopp,

Enclosed is the final validation report for the fraction listed below. This SDG was received on August 18, 2016. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project #36925:

SDG #	Fraction
PR161861	Polychlorinated Biphenyls as Congeners

The data validation was performed under Level III guidelines. The analyses were validated using the following documents, as applicable to each method:

- Quality Assurance Project Plan for Monitoring Stormwater Retrofit in the Echo Lake Drainage Basin-RSMP Effectiveness Study, June 2015
- US Environmental Protection Agency Region 10 SOP for the Validation of Polychlorinated Biphenyl Data, Revision 1.0, December 8, 1995

Please feel free to contact us if you have any questions.

Sincerely,

Stella Cuenco
Operations Manager/Senior Chemist

Introduction

This Data Validation Report (DVR) presents data validation findings and results for the associated samples listed on the cover page. Data validation was performed in accordance with the Quality Assurance Project Plan for Monitoring Stormwater Retrofit in the Echo Lake Drainage Basin-RSMP Effectiveness Study (June 2015) and US Environmental Protection Agency (EPA) Region 10 SOP for the Validation of Polychlorinated Biphenyl (PCB) Data (Revision 1.0, December 8, 1995). Where specific guidance was not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Polychlorinated Biphenyls (PCBs) as Congeners by Environmental Protection Agency (EPA) Method 1668C

All sample results were subjected to Level III data validation, which comprises an evaluation of quality control (QC) summary results.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

- J1 Blank Contamination: Indicates possible high bias and/or false positives.
- J2 Calibration Range exceeded: Indicates possible low bias.
- J3 Holding times not met: Indicates low bias for most analytes.
- J4 Other QC parameters outside control limits: bias not readily determined.
- J5 Other QC parameters outside control limits. The reported results appear to be biased high. The actual value of target compound in the sample may be lower than the value reported by the laboratory.
- J6 Other QC parameters outside control limits. The reported results appear to be biased low. The actual value of target compound in the sample may be higher than the value reported by the laboratory.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt and Technical Holding Times

All samples were received in good condition and cooler temperatures upon receipt met validation criteria.

All technical holding time requirements were met.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required frequency.

The static resolving power was at least 10,000 (10% valley definition).

III. Initial Calibration and Initial Calibration Verification

A five point initial calibration was performed as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all compounds were within validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration results were within the QC limits for unlabeled compounds and labeled compounds.

The ion abundance ratios for all compounds were within validation criteria.

V. Laboratory Blanks

Laboratory blanks were analyzed as required by the method. No contaminants were found in the laboratory blanks with the following exceptions:

Blank ID	Extraction Date	Compound	Concentration	Associated Samples
MBFS07131605	06/28/16	PCB-002 Monochlorobiphenyls	21.5 pg/L 21.5 pg/L	L64999-1 L64999-3 L64999-5 L64999-7 L64999-9 L64999-11 L64999-13 L64999-15 L64999-17 L64999-17DUP

Blank ID	Extraction Date	Compound	Concentration	Associated Samples
MBFS07111608	06/26/16	PCB-011 PCB-194 Dichlorobiphenyls Octachlorobiphenyls	41.4 pg/L 0.49 pg/L 41.4 pg/L 0.5 pg/L	L64379-2 L64379-4 L64648-1 L64648-3 L64648-5 L64648-7 L64648-9 L64921-1 L64921-3 L64921-9 L64921-11 L64921-9DUP

Sample concentrations were compared to concentrations detected in the laboratory blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated laboratory blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
L64999-17	Monochlorobiphenyls	6.7 pg/L	6.7J pg/L

L64921-1	PCB-011 Dichlorobiphenyls	135 pg/L 135 pg/L	135U pg/L 135J pg/L

Laboratory blank results flagged "N" or "NJ" by the laboratory as estimated maximum possible concentration (EMPC) are considered not detected.

VI. Field Blanks

No field blanks were identified in this SDG.

VII. Matrix Spike/Matrix Spike Duplicates/Duplicate Sample Analysis

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

Duplicate (DUP) sample analysis was performed on an associated project sample. Results were within QC limits.

VIII. Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required by the method. Percent recoveries (%R) were within QC limits.

IX. Field Duplicates

No field duplicates were identified in this SDG.

X. Internal Standards

All internal standard recoveries (%R) were within QC limits.

XI. Compound Quantitation

All compound quantitations were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG PR161861	All compounds flagged "N" or "NJ" by the laboratory as estimated maximum possible concentration (EMPC).	U	A

Raw data were not reviewed for Level III validation.

XII. Target Compound Identification

Raw data were not reviewed for Level III validation.

XIII. System Performance

Raw data were not reviewed for Level III validation.

XIV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to results reported by the laboratory as EMPCs, data were qualified as not detected in twenty samples.

Due to laboratory blank contamination, data were qualified as not detected or estimated in seven samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the data validation all other results are considered valid and usable for all purposes.

SUBJECT: LDW Shoreline-Echo Lake SW Eff Monitoring, Data Validation

Dear Mr. Grothkopp,

Enclosed is the final validation report for the fraction listed below. This SDG was received on August 18, 2017. Attachment 1 is a summary of the samples that were reviewed for analysis.

LDC Project #38487:

SDG #	Fraction
PR164565	Polychlorinated Biphenyls as Congeners

The data validation was performed under Level III guidelines. The analyses were validated using the following documents, as applicable to each method:

- Quality Assurance Project Plan for Monitoring Stormwater Retrofit in the Echo Lake Drainage Basin-RSMP Effectiveness Study, June 2015
- US Environmental Protection Agency Region 10 SOP for the Validation of Polychlorinated Biphenyl Data, Revision 1.0, December 8, 1995

Please feel free to contact us if you have any questions.

Sincerely,

Stella Cuenco
Operations Manager/Senior Chemist

Introduction

This Data Validation Report (DVR) presents data validation findings and results for the associated samples listed on the cover page. Data validation was performed in accordance with the Quality Assurance Project Plan for Monitoring Stormwater Retrofit in the Echo Lake Drainage Basin-RSMP Effectiveness Study (June 2015) and US Environmental Protection Agency (EPA) Region 10 SOP for the Validation of Polychlorinated Biphenyl (PCB) Data (Revision 1.0, December 8, 1995). Where specific guidance was not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Polychlorinated Biphenyls (PCBs) as Congeners by Environmental Protection Agency (EPA) Method 1668C

All sample results were subjected to Level III data validation, which comprises an evaluation of quality control (QC) summary results.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

J1 Blank Contamination: Indicates possible high bias and/or false positives.

J2 Calibration Range exceeded: Indicates possible low bias.

J3 Holding times not met: Indicates low bias for most analytes.

J4 Other QC parameters outside control limits: bias not readily determined.

J5 Other QC parameters outside control limits. The reported results appear to be biased high. The actual value of target compound in the sample may be lower than the value reported by the laboratory.

J6 Other QC parameters outside control limits. The reported results appear to be biased low. The actual value of target compound in the sample may be higher than the value reported by the laboratory.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt and Technical Holding Times

All samples were received in good condition.

The chain-of-custodies were reviewed for documentation of temperatures. Although the cooler temperature was reported at 9.5°C upon receipt by the laboratory, no data was qualified based on the cooler temperature since the temperature was below the validation criteria of 10°C.

All technical holding time requirements were met.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required frequency.

The static resolving power was at least 10,000 (10% valley definition).

III. Initial Calibration and Initial Calibration Verification

A five point initial calibration was performed as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all compounds were within validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration results were within the QC limits for unlabeled compounds and labeled compounds.

The ion abundance ratios for all compounds were within validation criteria.

V. Laboratory Blanks

Laboratory blanks were analyzed as required by the method. No contaminants were found in the laboratory blanks with the following exceptions:

Blank ID	Extraction Date	Compound	Concentration	Associated Samples
MBPC170001B	01/04/17	PCB-003	1.58 pg/L	L66175-1

VI. Field Blanks

No field blanks were identified in this SDG.

VII. Matrix Spike/Matrix Spike Duplicates/Duplicate Sample Analysis

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

Duplicate (DUP) sample analysis was performed on an associated project sample. Results were within QC limits.

VIII. Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required by the method. Percent recoveries (%R) were within QC limits.

IX. Field Duplicates

No field duplicates were identified in this SDG.

X. Internal Standards

All internal standard recoveries (%R) were within QC limits.

XI. Compound Quantitation

All compound quantitations were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
L66175-1 L66175-3 L66285-1 L66285-3 L66382-9 L66382-11 L66382-17 L66382-19 L66384-1 L66435-3 L66498-9 L66498-11 L66498-13 L66498-15 L66285-3DUP	All compounds flagged "N" or "NJ" by the laboratory as estimated maximum possible concentration (EMPC).	U	A

Raw data were not reviewed for Level III validation.

XII. Target Compound Identification

Raw data were not reviewed for Level III validation.

XIII. System Performance

Raw data were not reviewed for Level III validation.

XIV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to results reported by the laboratory as EMPCs, data were qualified as not detected in nineteen samples.

Due to laboratory blank contamination, data were qualified as not detected or estimated in nineteen samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the data validation all other results are considered valid and usable for all purposes.

SUBJECT: Revised LDW Shoreline-Echo Lake SWE #2, Data Validation

Dear Mr. Grothkopp,

Enclosed is the revised validation report for the fraction listed below. This SDG was received on May 18, 2017. Attachment 1 is a summary of the samples that were reviewed for analysis.

LDC Project #38726:

SDG #	**Fraction**
PR171233	Polychlorinated Biphenyls as Congeners

Revision: Added U qualifier to PCB-031 for sample L66938-19 due to blank contamination.

Please feel free to contact us if you have any questions.

Sincerely,

Stella Cuenco
Operations Manager/Senior Chemist

Introduction

This Data Validation Report (DVR) presents data validation findings and results for the associated samples listed on the cover page. Data validation was performed in accordance with the Quality Assurance Project Plan for Monitoring Stormwater Retrofit in the Echo Lake Drainage Basin-RSMP Effectiveness Study (June 2015) and US Environmental Protection Agency (EPA) Region 10 SOP for the Validation of Polychlorinated Biphenyl (PCB) Data (Revision 1.0, December 8, 1995). Where specific guidance was not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Polychlorinated Biphenyls (PCBs) as Congeners by Environmental Protection Agency (EPA) Method 1668C

All sample results were subjected to Level III data validation, which comprises an evaluation of quality control (QC) summary results.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

J1 Blank Contamination: Indicates possible high bias and/or false positives.

J2 Calibration Range exceeded: Indicates possible low bias.

J3 Holding times not met: Indicates low bias for most analytes.

J4 Other QC parameters outside control limits: bias not readily determined.

J5 Other QC parameters outside control limits. The reported results appear to be biased high. The actual value of target compound in the sample may be lower than the value reported by the laboratory.

J6 Other QC parameters outside control limits. The reported results appear to be biased low. The actual value of target compound in the sample may be higher than the value reported by the laboratory.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt and Technical Holding Times

All samples were received in good condition.

The chain-of-custodies were reviewed for documentation of temperatures. Although the cooler temperature was reported at 7.6°C upon receipt by the laboratory, no data was qualified based on the cooler temperature since the temperature was below the validation criteria of 10°C.

All technical holding time requirements were met.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required frequency.

The static resolving power was at least 10,000 (10% valley definition).

III. Initial Calibration

A five point initial calibration was performed as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all compounds were within validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration results were within the QC limits for unlabeled compounds and labeled compounds.

The ion abundance ratios for all compounds were within validation criteria.

V. Laboratory Blanks

Laboratory blanks were analyzed as required by the method. No contaminants were found in the laboratory blanks with the following exceptions:

Blank ID	Extraction Date	Compound	Concentration	Associated Samples
MBPC170234B	04/11/17	PCB-011 PCB-031 Dichlorobiphenyls Trichlorobiphenyls	58.9 pg/L 4.15 pg/L 58.9 pg/L 4.2 pg/L	All samples in SDG PR171233

Sample concentrations were compared to concentrations detected in the laboratory blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated laboratory blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
L66938-7	PCB-011 Dichlorobiphenyls	52.9 pg/L 52.9 pg/L	52.9U pg/L 52.9U pg/L
L66938-7DUP	PCB-011 Dichlorobiphenyls	42.7 pg/L 42.7 pg/L	42.7U pg/L 42.7U pg/L
L66938-15	PCB-011 Dichlorobiphenyls	77.2 pg/L 77.2 pg/L	77.2U pg/L 77.2U pg/L
L66938-19	PCB-011 PCB-031 Dichlorobiphenyls	53.4 pg/L 4.11 pg/L 53.4 pg/L	53.4U pg/L 4.11U pg/L 53.4U pg/L
L67070-5	PCB-011 Dichlorobiphenyls	235 pg/L 279 pg/L	235U pg/L 279J pg/L
L67070-7	PCB-011 Dichlorobiphenyls	22.7 pg/L 22.7 pg/L	22.7U pg/L 22.7U pg/L
L67413-1	PCB-011 PCB-031 Dichlorobiphenyls Trichlorobiphenyls	21.3 pg/L 3.66 pg/L 21.3 pg/L 11.2 pg/L	21.3U pg/L 3.66U pg/L 21.3U pg/L 11.2J pg/L
L67413-3	PCB-011 PCB-031 Dichlorobiphenyls Trichlorobiphenyls	25 pg/L 3.1 pg/L 25 pg/L 6.3 pg/L	25U pg/L 3.1U pg/L 25U pg/L 6.3J pg/L
L67413-4	PCB-011 PCB-031 Dichlorobiphenyls Trichlorobiphenyls	22.2 pg/L 0.94 pg/L 22.2 pg/L 8 pg/L	22.2U pg/L 0.94U pg/L 22.2U pg/L 8J pg/L

VI. Field Blanks

No field blanks were identified in this SDG.

VII. Matrix Spike/Matrix Spike Duplicates/Duplicate Sample Analysis

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

Duplicate (DUP) sample analysis was performed on an associated project sample. Results were within QC limits.

VIII. Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required by the method. Percent recoveries (%R) were within QC limits with the following exceptions:

LCS ID	Compound	%R (Limits)	Associated Samples	Flag	A or P
PC170235S	PCB-074	140.8 (60-135)	L66938-13 L66938-17 L66938-19 L67070-5	J (all detects)	P

IX. Field Duplicates

No field duplicates were identified in this SDG.

X. Internal Standards

All internal standard recoveries (%R) were within QC limits.

XI. Compound Quantitation

All compound quantitations were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG PR171233	All compounds flagged “N” or “NJ” by the laboratory as estimated maximum possible concentration (EMPC).	U	A

Raw data were not reviewed for Level III validation.

XII. Target Compound Identification

Raw data were not reviewed for Level III validation.

XIII. System Performance

Raw data were not reviewed for Level III validation.

XIV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to LCS %R and results reported by the laboratory as EMPCs, data were qualified as estimated in twelve samples.

Due to laboratory blank contamination, data were qualified as not detected or estimated in nine samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the data validation all other results are considered valid and usable for all purposes.

APPENDIX H1 – DETAILED DATA SUMMARY

This section presents a detailed summary of the data used to prepare the report. Presented first are tables of summary statistics (i.e., minimum, maximum, mean, and median) for each parameter and sampling location (i.e., bioretention planter boxes (BPBs), the Filterra® (FLT), and detention tank system (DTS). Figures summarizing results for each parameter are presented below these tables.

Table H1-1. Summary of validated results for conventional parameters and bacteria* for each site.

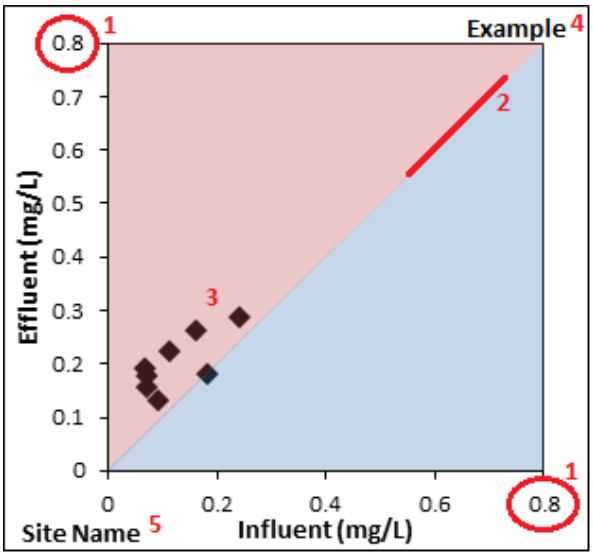
Cond – conductivity; Temp – temperature; DO – dissolved oxygen; Turb - turbidity;
FOD – frequency of detection; NC – not calculated due to low sample number; J – estimated value

The following pages include figures summarizing results for the BPBs and Filterra for each parameter, including field measurements. Each page includes five figures that summarize results for a single parameter, including four scatter plots of influent and effluent concentrations (one for each site) and a box plot displaying the distribution of results for each site. The example figures below provide explanations for the two figure types.

Scatter Plot Explanation:



These figures plot effluent versus influent concentrations for each sampling event at a given site.

1 – The x and y scales are the same for all scatter plots of the same parameter, unless the axis labels are in red. Red labels indicate abnormally low or high concentrations compared to the other sites.

2 – The middle line between the red and blue shading represents no change between influent and effluent concentrations, or a 1 to 1 ratio.

3 – Data points in the red shading illustrate sampling events where concentrations were higher in the effluent than the influent (> 1 to 1 ratio). Data points in the blue shading illustrate sampling events where concentrations were lower in the effluent than the influent (< 1 to 1 ratio).

4 – Name of parameter

5 – Site name

** Figures with several non-detect results include red lines indicating the method detection limit.*

APPENDIX H2 – TOXICITY TEST RESULTS

Toxicity tests using *Daphnia pulex* (48-hour acute test) and *Ceriodaphnia dubia* (7-day chronic test) were conducted on samples from four storm events at BPB1. No acute toxicity was observed in the *D. pulex* tests. Three of the four influent samples were toxic to *C. dubia*, with greatest toxicity observed for the sample with highest contaminant concentrations (1/17/17). Dilution series were run for two events, but these exposures did not result in toxicity. Appendix F3 includes full toxicity reports. Table H2-1 summarizes the toxicity results and notable water quality parameters.

Table H2-1. Summary of toxicity test results and water quality parameters.

Storm Event	Sample Type	*Daphnia pulex*	*Ceriodaphnia dubia*		Hardness	Alkalinity	TSS	Dissolved Copper	Dissolved Zinc	Total PAHs
		Mean % Survival	Mean % Survival	Mean Reproduction	(mg $CaCO_3$/L)	(mg $CaCO_3$/L)	(mg/L)	(µg/L)	(µg/L)	(µg/L)

* Statistically significant reduction in survival or reproduction compared to control response ($p < 0.05$; Appendix E describes statistical methods).
† Statistically significant reduction in survival or reproduction in the inlet response compared to outlet response ($p<0.05$; Appendix E).
-- – not analyzed; J – estimated value; U – non-detect value;
Low hardness controls were utilized, because the low hardness in project samples was not adjusted and could potentially impact survival.

APPENDIX H3 – RELATIONSHIPS BETWEEN PARAMETERS

Understanding the relationships between parameters can provide better insight into how the BMPs are affecting water quality and the conditions under which they will be most effective. For example, conventional parameters like organic carbon and suspended solids can affect removal efficiencies for some pollutants. This section explores the relationships between parameters using linear regressions and visual observations for the data collected at the BPBs installed in 2012 (i.e., BPB1, BPB2, and BPB3). When patterns were similar across these three sites, the results are summarized as a combined dataset. Data from BPB4, the Filterra and the DTS are not included in this section due to limited sample size.

Metals

Metals can be present in stormwater in a variety of forms, which can affect how well they are removed by bioretention and their toxicity. Dissolved metals includes freely dissolved metal ions and metals associated with particulates less than 0.45µm, including dissolved organic carbon (DOC). Total metals includes all dissolved metals and metals as particulates greater 0.45µm. Bioretention provides an effective physical filter for particulate metals; however, removal efficiency of dissolved metals depends more on chemical interactions, such as the metal's affinity for the media compared to the metal's affinity for DOC in the stormwater. This can vary with different metals and under different conditions including pH and amount of time stormwater is retained in the BMP.

Copper

The BPBs effectively reduced total copper (Section 2.1 of main report). The evidence suggests removal was achieved primarily through physical filtration of particulates. There was a strong relationship between total copper and TSS in the influent, but not in effluent where the majority of copper was present in the dissolved form (Figures H3-1 and H3-2).

Dissolved copper influent concentrations were not significantly reduced in the effluent. Dissolved copper was strongly related to DOC in the influent and moderately related to DOC in the effluent (Figure H3-3). Dissolved copper has a particularly high affinity to DOC compared to other stormwater metals, such as zinc (Kaschl et al. 2002, Li and Davis 2008, McBride et al. 1997, Silvertooth 2014,). Previous research has shown this strong relationship between dissolved copper and DOC in stormwater can prevent dissolved copper from binding with bioretention media, thus affecting treatment effectiveness (King County 2014, Li and Davis 2008, Silvertooth 2014, Zhou and Wong 2001). The relationships discussed in this section corroborate these findings.

Zinc

In contrast to copper, the BPBs efficiently reduced both total and dissolved zinc (Section 2.1 of the main report). There was a strong relationship between total zinc and TSS in the influent and the effluent (Figures H3-4), and the majority of total zinc was present in the particulate fraction in both influent and effluent (H3-5). Dissolved zinc was strongly related to DOC in the influent, but not related to DOC in the effluent (Figure H3-6). These data suggest that while dissolved zinc may have been associated with DOC in the influent, the association was not strong enough to prevent dissolved zinc from binding with the BPB media.

Cadmium and Lead

Data for cadmium and lead were limited due to infrequent detections, particularly in the effluent. Total cadmium and lead were strongly related to TSS in the influent, as was total lead in the effluent (Figures H3-7 and H3-8).

DOC

Concentrations of DOC tended to be higher in effluent compared to influent (e.g., average influent 2.09 mg/L, average effluent 4.29 mg/L). However, no statistical tests were conducted with DOC results, because this analyte was added partway through the study, resulting in a lower sample size at each individual site. Due to the lack of flow data, it was not possible to determine whether the observed concentration increase was due to an increase in DOC mass, or a decrease in stormwater volume (volume changes discussed in Section 2.1 of the main report). An increase of DOC mass is possible if the media is introducing DOC to the treated stormwater (Li and Davis 2009). If this is the case, the media could also release any OC-bound contaminants from the media, such as copper and hydrophobic organic contaminants; however, results of this study do not suggest this occurred at the BPBs or Filterra.

Nutrients

Total phosphorus and nitrogen were strongly related to TSS in the influent, but were not related to TSS in the effluent (Figures H3-9 and H3-10). This is likely due to export of dissolved nutrients from the media, particularly for phosphorus. For example, phosphorus concentrations were higher in effluent than the influent. Orthophosphate phosphorus comprised an average of 7% of the influent total phosphorus, but an average of 80% of the effluent total phosphorus (Figure H3-11).

Organic Contaminants

The organic contaminants analyzed in this study were lube-oil-/diesel-range petroleum hydrocarbons (TPH-Dx), polycyclic aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs). These compounds are fairly hydrophobic indicating they have low solubility in water and are generally associated with suspended solids and organic matter. There was a moderate to strong relationship between influent concentrations of organic contaminants and TSS (Figures H3-12 through H3-14). Relationships between effluent concentrations could only be assessed for total PCBs due to low frequency of detection of the other organic contaminants, but no relationship was observed (Figure H3-14). Total organic carbon (TOC) was not analyzed in most samples; therefore, the relationship between organic contaminants and TOC could not be assessed.

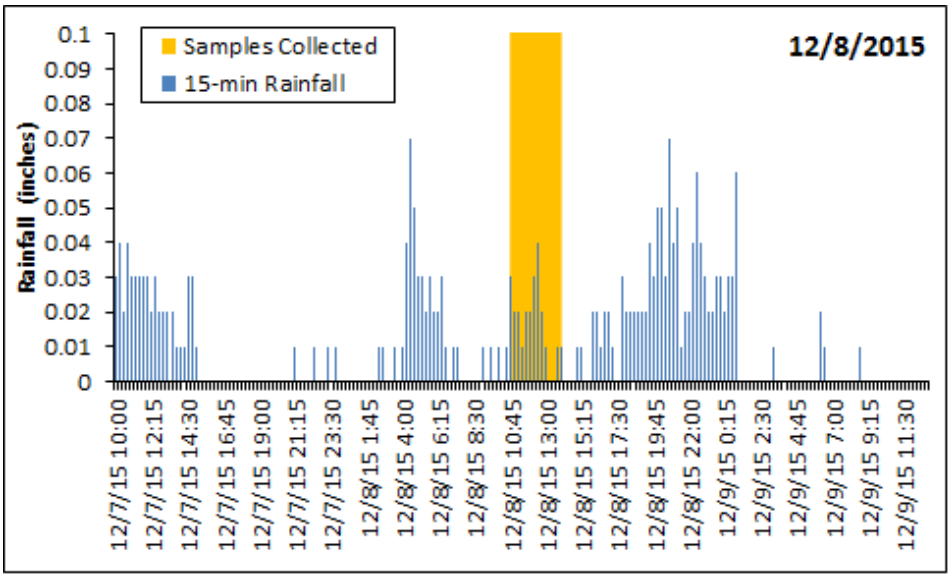
APPENDIX H4 – STORM CONDITIONS

Samples could only be collected from the BPBs during relatively intense rainfall (i.e., generally >0.03 inches/15-minutes). Due to storm intensity requirements, along with daylight constraints for field safety, sampling timespans were often shorter than specified in the Quality Assurance Project Plan (QAPP; King County 2015a) resulting in sample collection from a fairly narrow range of storm conditions. The following figures present rainfall for each sampling event, as well conditions about 24 hours before and after the sampling event. The yellow bar highlights when BPB and Filterra samples were collected. Storm conditions on January 17, 2017 were notably different and are discussed below.



Notes:
- BPB1 and BPB2 sampled. Not ready for sampling at other sites.
- ~0.24 inches total rain during sampling

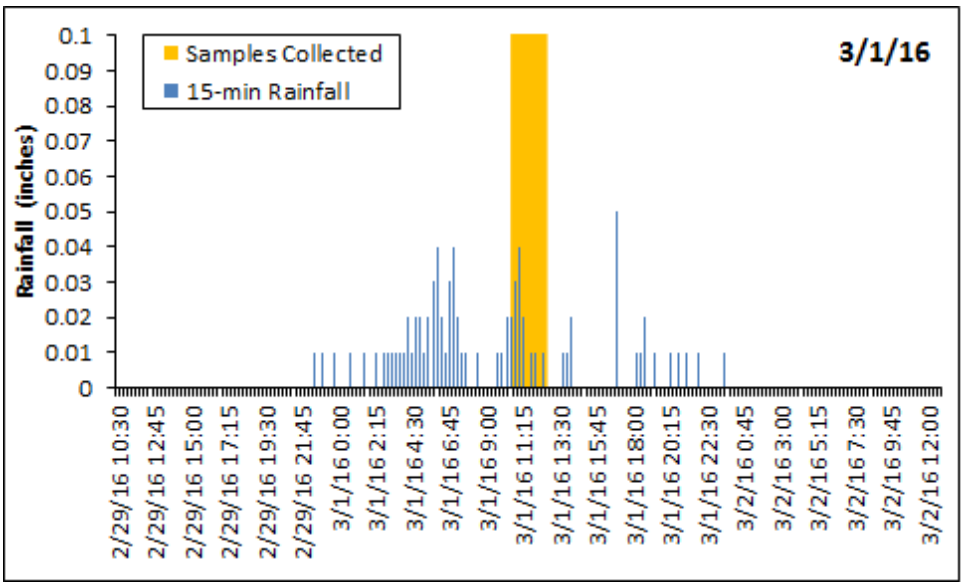
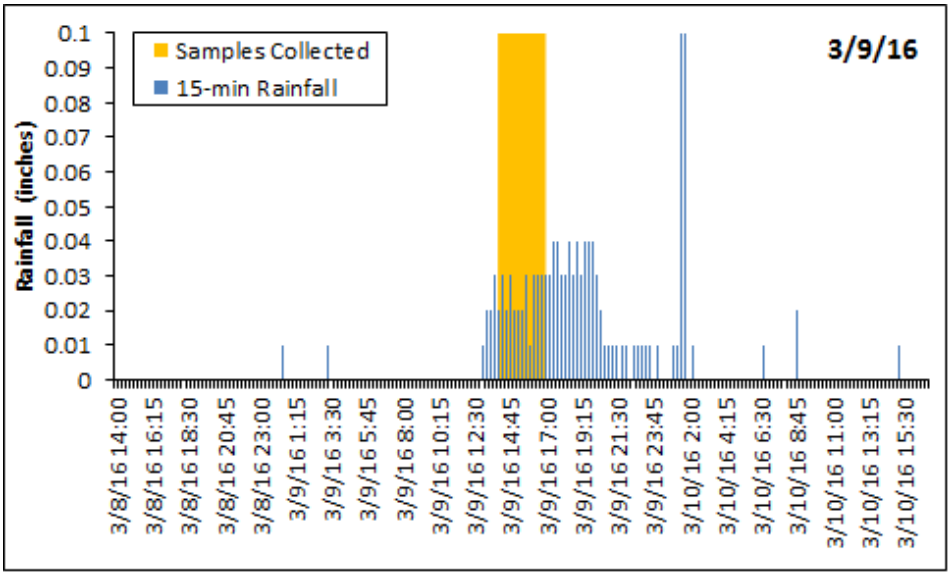
Notes:
- BPB1 and BPB2 sampled. Not ready for sampling at other sites.
- ~0.56 inches total rain during sampling

Table H4-2. Rainfall around the 1/21/16 sampling event.



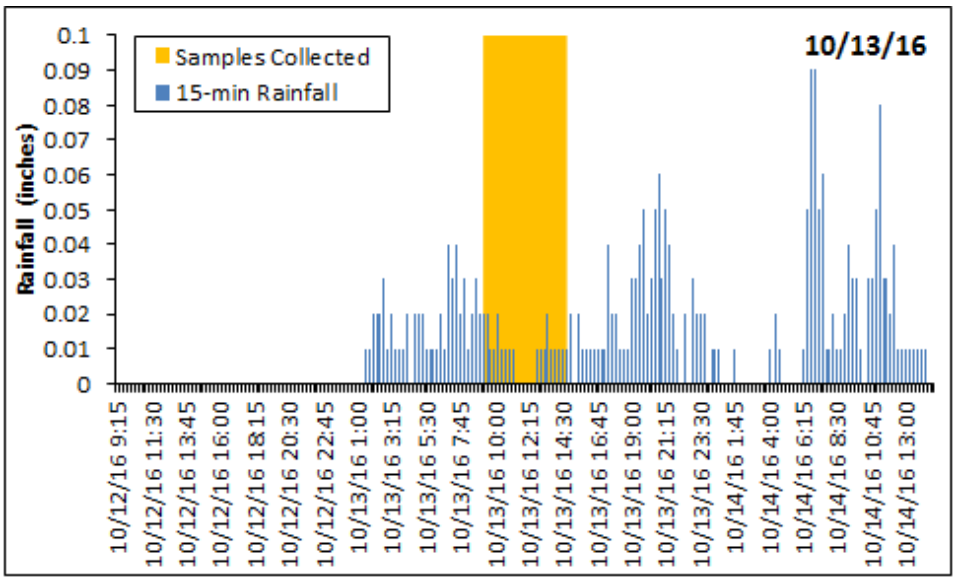
Notes:
- BPB1, BPB2, BPB3, and Filterra sampled.
- ~0.14 inches total rain during sampling

Table H4-3. Rainfall around the 3/1/16 sampling event.



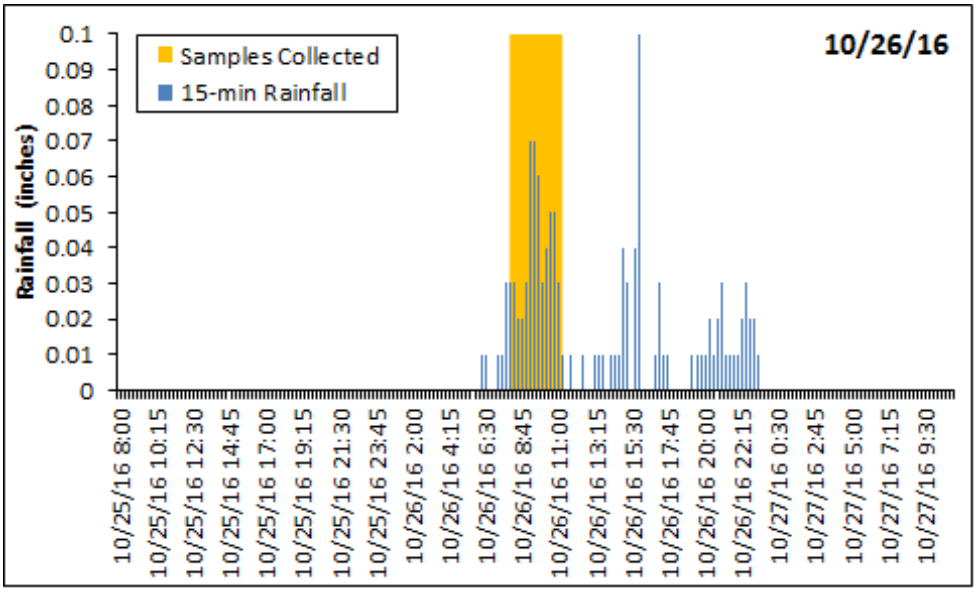
Notes:
- BPB1, BPB2, BPB3, and Filterra sampled.
- ~0.32 inches total rain during sampling

Table H4-4. Rainfall around the 3/9/16 sampling event.



Notes:
- Only BPB3 and Filterra could be sampled due to low rain intensity.
- ~0.22 inches total rain during sampling

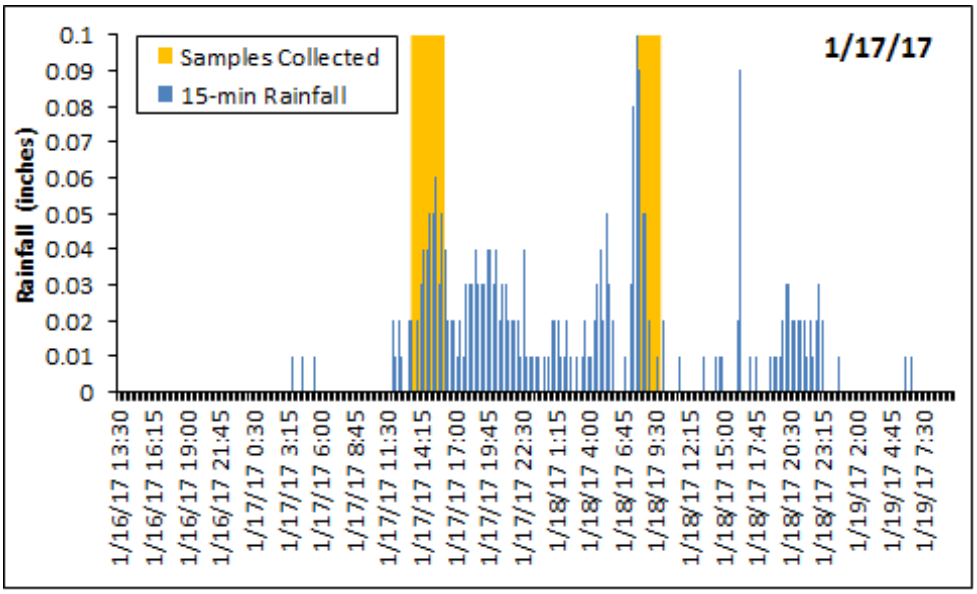
Table H4-5. Rainfall around the 10/13/16 sampling event.



Notes:

- BPB1, BPB2, BPB3, BPB4, and Filterra sampled.
- ~0.54 inches total rain during sampling

Table H4-6. Rainfall around the 10/26/16 sampling event.



Notes:

First attempt:

- BPB1, BPB2, BPB3, and Filterra sampled. No effluent flow at BPB4.
- ~0.36 inches total rain

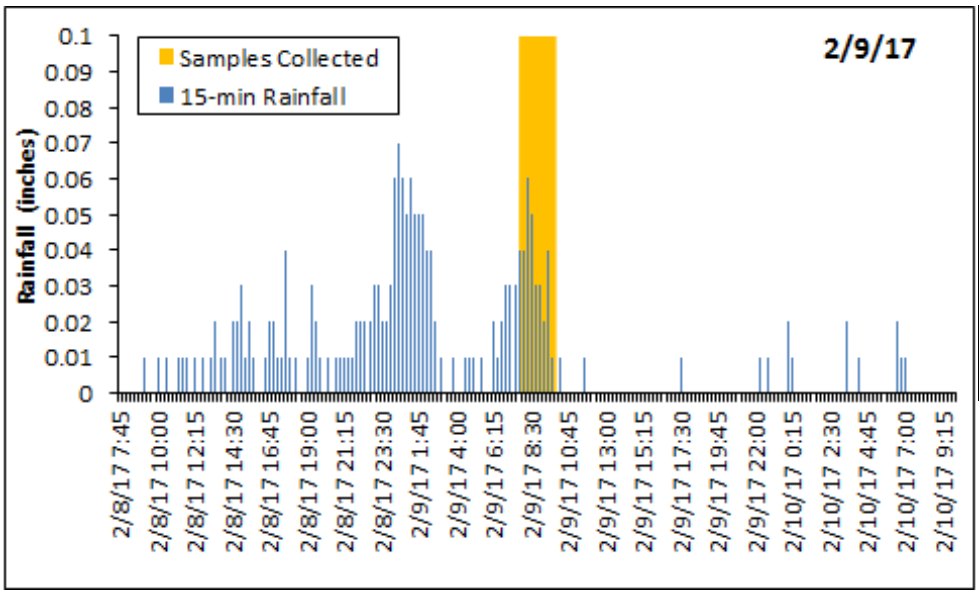
Second attempt:

- BPB4 sampled.
- ~0.32 inches total rain

Table H4-7. Rainfall around the 1/17/17 sampling event.

Notable sampling event – January 17, 2017:

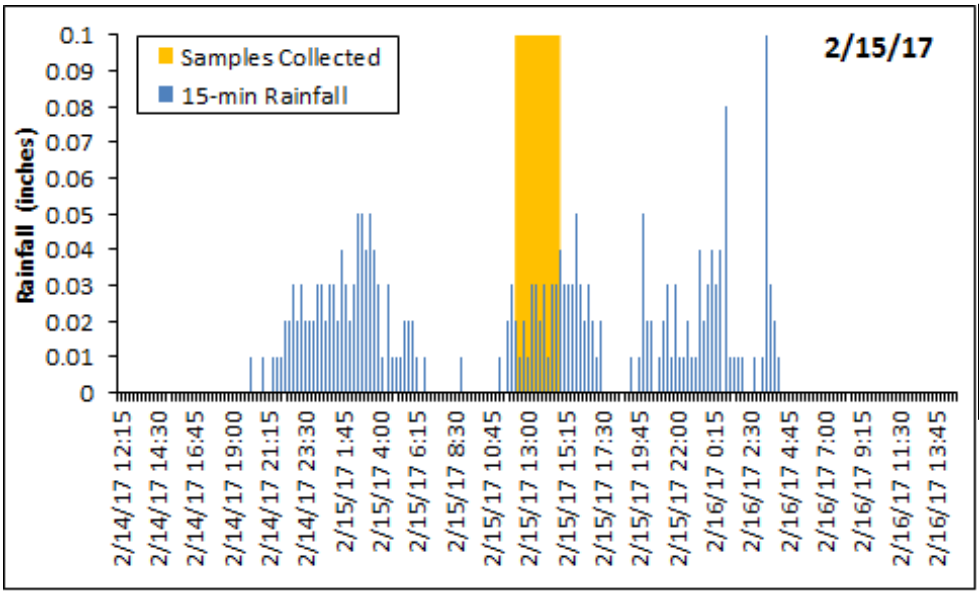
This sampling event occurred during a rain event that followed over two weeks of almost no rain and freezing temperatures. The City of Shoreline had applied salt and Calcium Chloride with Boost to the icy streets. It is likely that the samples contained these de-icing agents. Conductivity was particularly high during this event with influent measurements between 102 and 360 umhos/cm and effluent measurements between 273 and 949 umhos/cm. Some of the highest influent and effluent contaminant concentrations were also observed during this event. However, treatment effectiveness remained comparable to other events based on percent reduction of contaminant concentrations.



Notes:

- BPB1, BPB2, and BPB3 sampled. Filterra flooded, no effluent at BPB4.
- ~0.32 inches total rain during sampling

Table H4-8. Rainfall around the 2/9/17 sampling event.



Notes:

- BPB1 and BPB3 sampled. Filterra flooded, no effluent at BPB2 and BPB4.
- ~0.28 inches total rain during sampling

Table H4-9. Rainfall around the 2/15/17 sampling event.

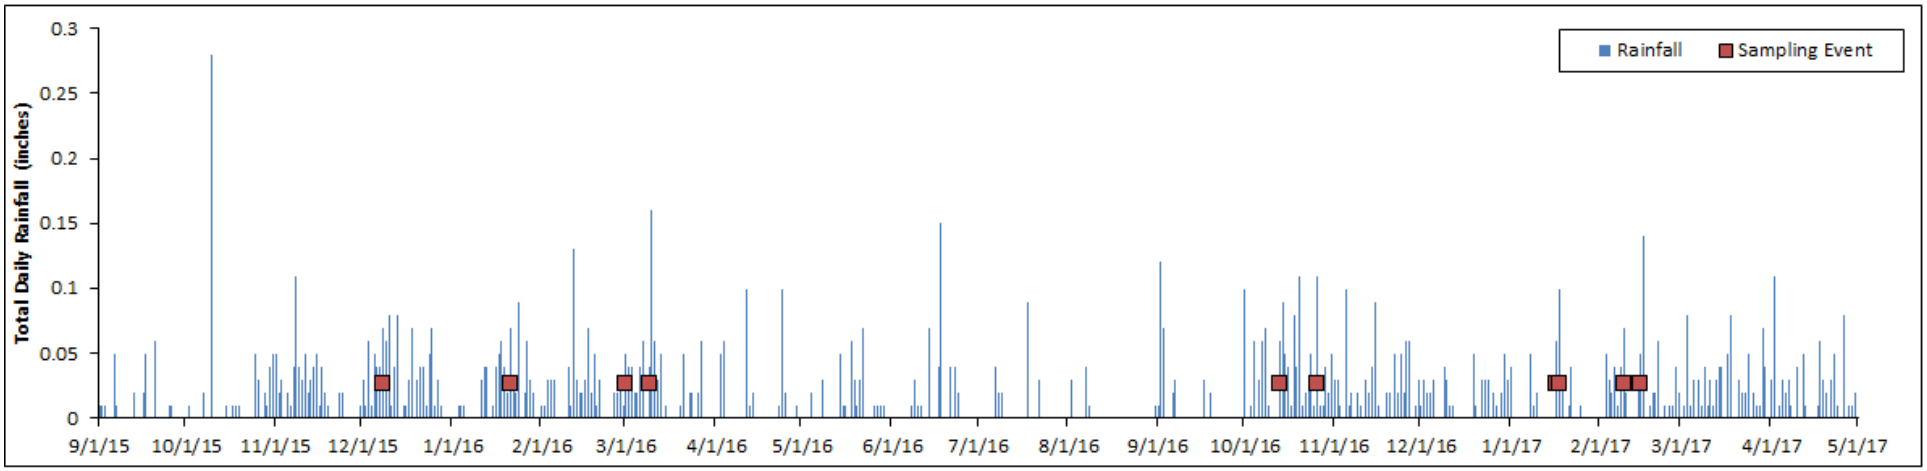


Table H4-10. Rainfall and BPB/Filterra sampling events over the entire project.

APPENDIX H5 – PCB PATTERNS FOR INDIVIDUAL BMPS

There was a dramatic decrease in PCB concentrations between influent and effluent at the individual BMPs. On average, homolog patterns were fairly similar between sites. The penta-PCBs were the most prevalent homolog, representing about one third of the total, followed by hexa-PCBs, at about one quarter of the total (Figure H5-1). Congeners 110 (penta-PCB), 138 (hexa-PCB), and 180 (hepta-PCB) were most frequently detected at greater than 10% of the total PCB concentration in influent samples. PCB-11 was a notable influence for some influent samples collected on 3/9/2016 and 1/17/2017.

Homolog patterns in the effluent were more variable between sites, but this was likely due to lower overall concentrations (i.e., relatively small differences in concentration will represent relatively large differences in percentages).

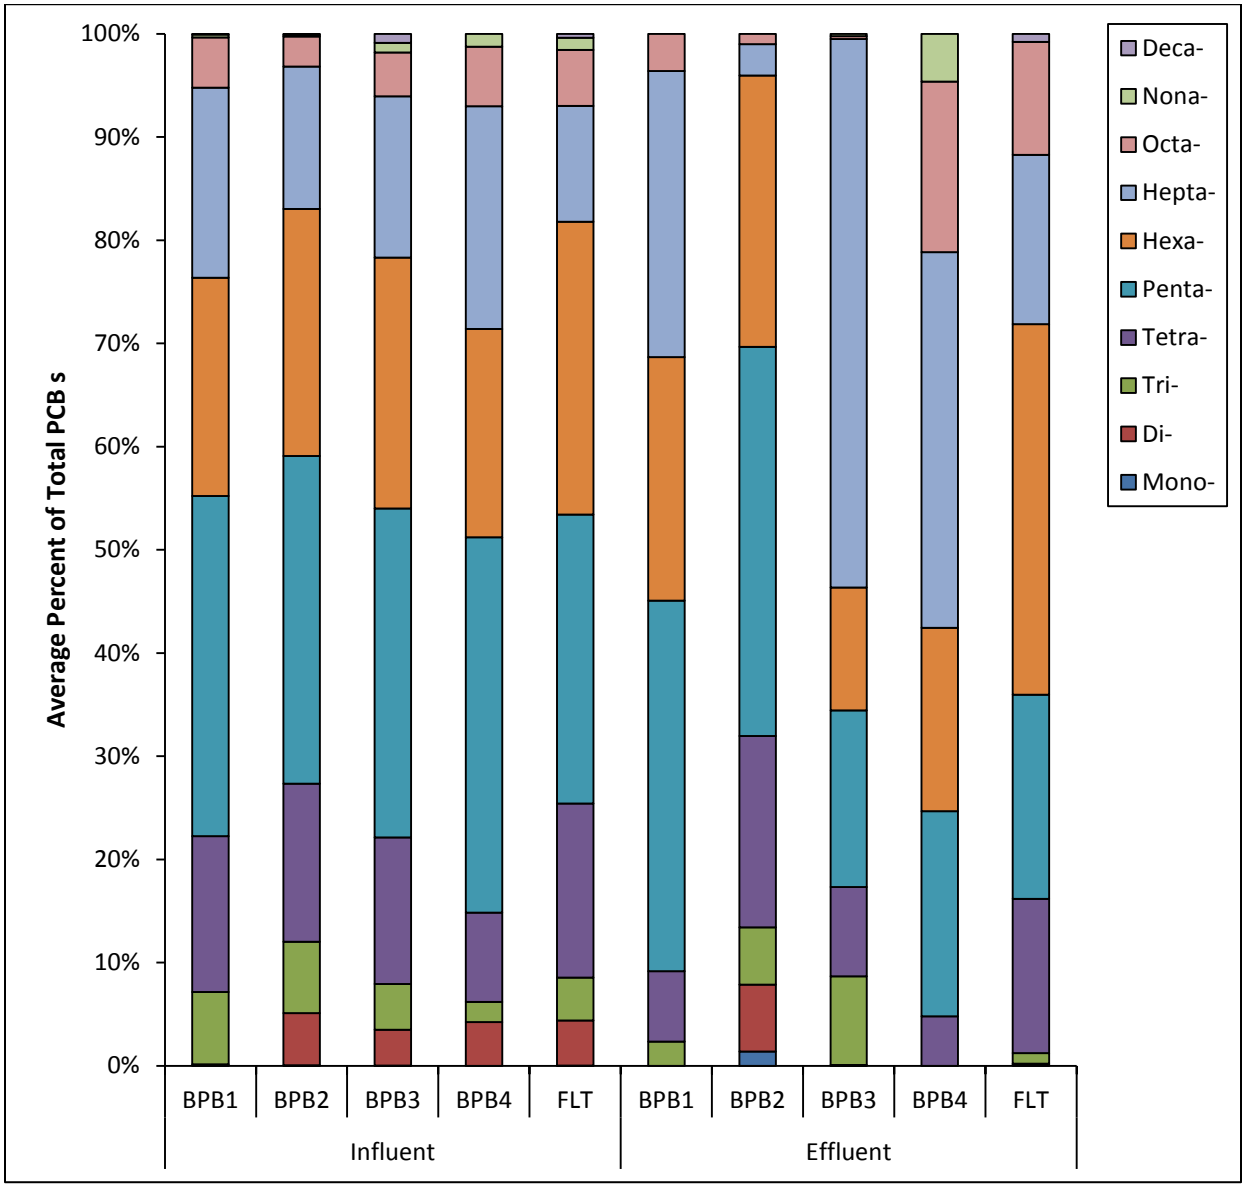

Figure H5-1. Homolog Patterns – Average Percent of Total PCB Concentrations

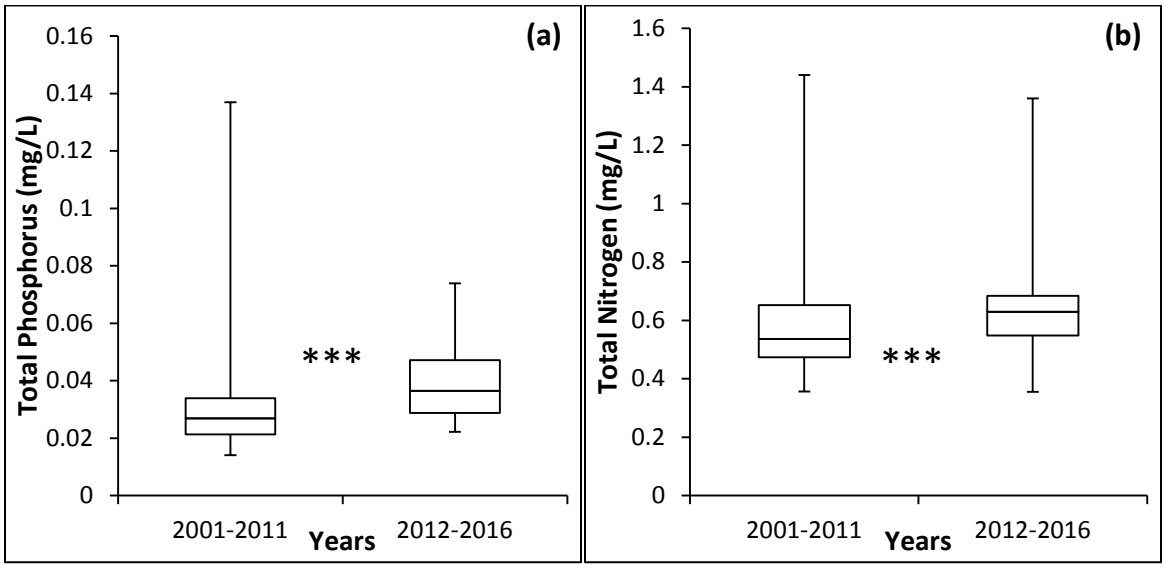
APPENDIX H6 – ECHO LAKE MONITORING SUMMARY

The City of Shoreline and King County's Small Lakes Monitoring Program have been monitoring Echo Lake water quality since 2001[1]. Bi-weekly water quality samples are collected from May through October at a mid-lake sampling station (one-meter depth). In addition, water samples at this location are collected twice a year from multiple depths to assess conditions in the full water column profile.

As part of King County's Swimming Beach Monitoring Program, water samples are also collected at one location near Echo Lake Park. Since 2004[2] weekly samples have been collected from May through September and analyzed for fecal coliform by the King County Environmental Laboratory.

Details about sampling and analytical methods are available in a technical memorandum produced as part of this project (King County 2015b). The memorandum summarized water quality data gathered at Echo Lake prior to construction of stormwater retrofits in the basin (2001-2011). This section builds on that summary to compare pre- and post-retrofit water quality in the lake and briefly explores potential causal factors for observed conditions.

Median surface concentrations of total phosphorus and nitrogen (one-meter depth) were compared between pre- and post-retrofit years to determine if nutrient levels in the lake had noticeably shifted since the retrofit. This exercise does not assume the retrofit caused any observed shift, instead it provides a starting point for the exploration. Mann-Whitney Rank Sum Tests showed statistically significant differences between median concentrations from 2001-2011 and 2012-2016 ($p<0.001$). However, as shown in Figures H6-1a and b, concentration ranges overlapped between the two timeframes.



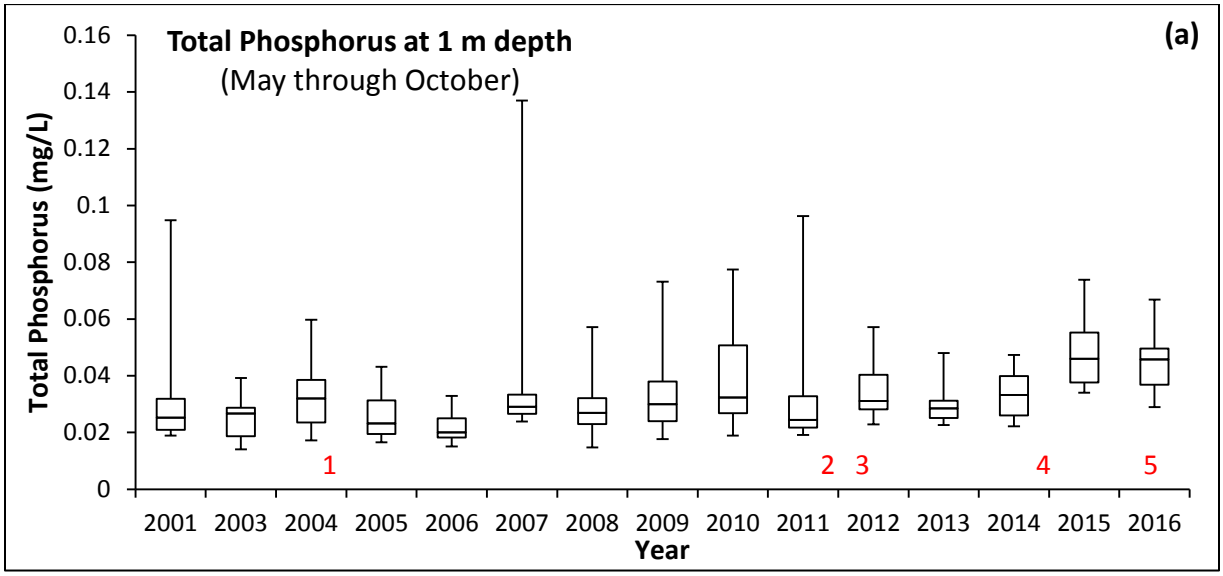
*** = Statistically significant differences between medians ($p<0.001$).

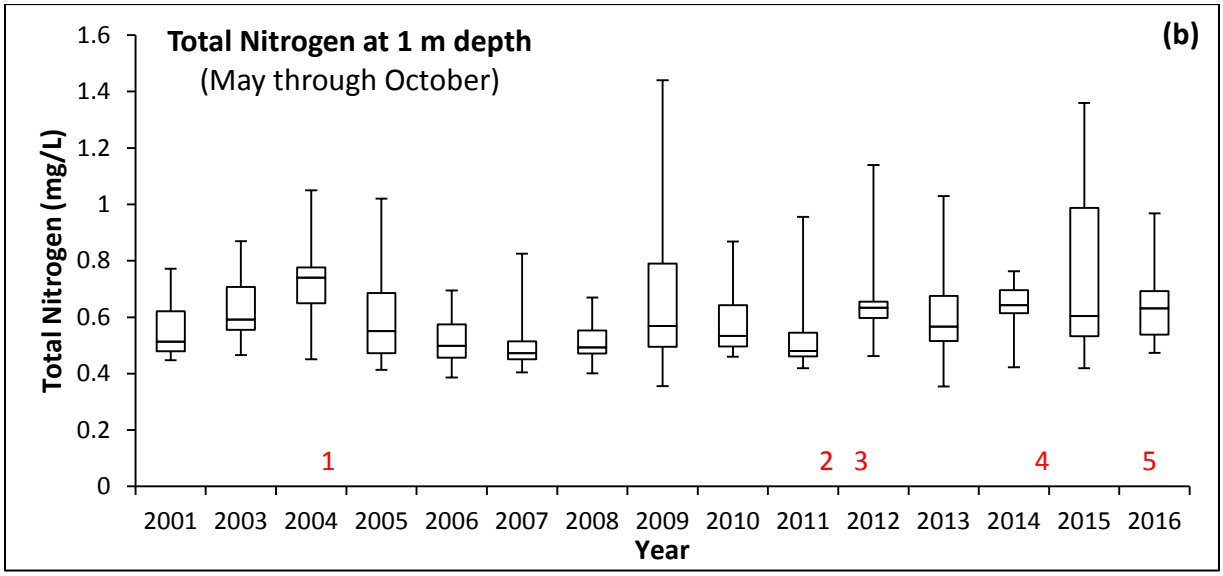
Figure H6-1. Distribution of Surface Water Quality Results from May through October for 2001-2011 and 2012-2016: (a) Total Phosphorus, (b) Total Nitrogen

[1] No water quality results are available from 2002.

[2] Bacteria sampling in 2014 was conducted only in May and June. Data from 2014 are not included in the comparisons, so that the full range of months are represented evenly across the years included in this analysis.

Figures H6-2a and b present the distribution of results for each year, which illustrates the intra-year variability and trends over time. These figures also include a timeline of known stormwater system activities in the basin. This timeline does not suggest major water quality changes corresponding with retrofit activities, although the highest minimum and median values for total phosphorus were observed in 2015 and 2016, respectively. These higher than average levels in 2015/2016 may be driving the statistical differences described above.





Stormwater System Activities:	
1) 2004-2005	source of nutrients and copper identified in basin, worked with business to mitigate
2) End of 2011:	detention tank system online for southern half of basin
3) June 2012:	treatment online in southern half of basin
4) End of 2014:	detention tank system online for northern half of basin
5) Mid-2016:	treatment online for northern half of basin

Figure H6-2. Distribution of Surface Water Quality Results from May through October for each Year, with a Timeline of Stormwater System Activities: (a) Total Phosphorus, (b) Total Nitrogen

The summers of 2015 and 2016 were unusually warm and dry, and small lakes around King County were highly impacted by algal blooms, which could contribute to higher surface phosphorus levels through retention of nutrients in algal biomass. The regional spike in algal blooms during these summers may indicate larger climatic differences in 2015 and 2016, rather than shifts due to unique landuse or stormwater system changes in the Echo Lake basin. Temperature may be an indirect, but influential, factor for abnormal phosphorus levels, but it is probably not the main driver influencing long-term phosphorus trends. Parsing out climatic influences versus local land use changes is outside the scope of this project and would require additional information (e.g., phytoplankton community assemblage, analysis of lakes throughout the region).

Lake sediment is likely an important source of phosphorus to the lake's water column. Echo Lake is stratified in the summer (i.e., a strong density gradient preventing mixing between surface and deep waters). Due to depleted dissolved oxygen at depth, the reducing conditions can cause phosphorus release from the sediment, which is seen through increasing phosphorus concentrations at depth in the summer (Figure H6-3). Insufficient data are available to accurately characterize the loading of phosphorus from stormwater or internal cycling. To do so, lake inflow and outflow data and a greater temporal resolution of total phosphorus in the lake's deep waters would be necessary.

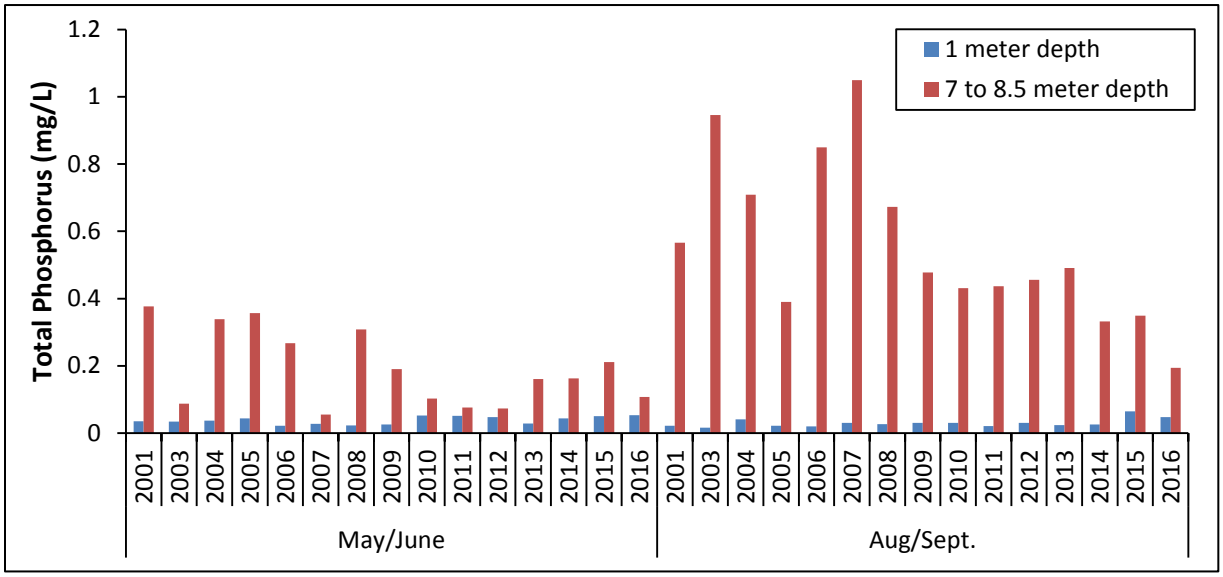


Figure H6-3. Comparison of Total Phosphorus Concentrations at Surface and at Depth for Early and Late Summer Sampling Events

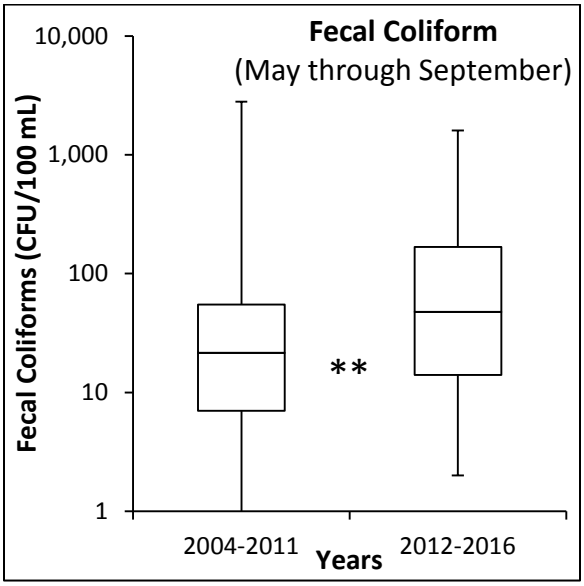
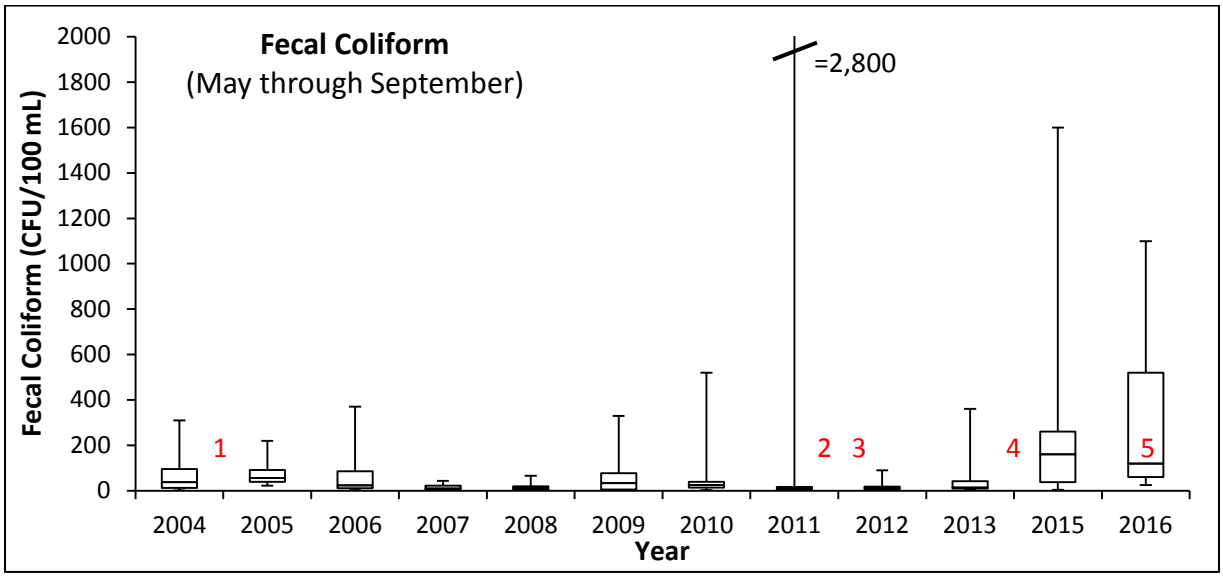
Fecal coliform results were also statistically compared between pre- and post-retrofit years. The median colony forming units (CFU) in May through September were higher for 2012-2016 compared to 2004-2011 based on a Mann-Whitney Rank Sum Test (Figure H6-4). In comparing distribution of data for each year, it is clear that 2015 and 2016 stand out as years with higher fecal coliform CFUs (Figure H6-5). In fact, the Echo Lake swimming beach was closed for six weeks in August and September 2015 (no closures occurred in 2016). Warmer than usual summer temperatures may have contributed to more swimmers with less "flushing" of the swimming beach areas due to dry weather. As with regional algal bloom patterns, this may be due to a regional cause, such as unusually hot and dry weather, rather than a landuse or stormwater system change that would be unique to the Echo Lake basin.



** = Statistically significant differences between medians (p=0.003).

Figure H6-4. Distribution of Fecal Coliform Results from May through September for 2004-2011 and 2012-2016



Stormwater System Activities:	
1) 2004-2005	source of nutrients and copper identified in basin, worked with business to mitigate
2) End of 2011:	detention tank system online for southern half of basin
3) June 2012:	treatment online in southern half of basin
4) End of 2014:	detention tank system online for northern half of basin
5) Mid-2016:	treatment online for northern half of basin

Figure H6-5. Distribution of Fecal Coliform Results from May through September for each Year, with a Timeline of Stormwater System Activities

Overall, Echo Lake water quality does not appear to be dramatically affected by stormwater retrofits in the basin. Phosphorus levels appear to be increasing slightly over time, with 2015 and 2016 experiencing abnormally high phosphorus and fecal coliform levels. These do not appear to be correlated to specific stormwater system changes in the basin.

Appendix I:
Summary of Flow Monitoring

This page intentionally left blank.

APPENDIX I – SUMMARY OF FLOW MONITORING

The project that was first proposed to the Regional Stormwater Monitoring Program (RSMP), now Stormwater Action Monitoring (SAM), did not include monitoring flow at the detention tank system (DTS). However, input from Washington State Stormwater Permitees during the RSMP Effectiveness Study Workshops showed there was interest in evaluating the flow control benefits and additional water quality benefits provided by the DTS. This appendix summarizes the progression of flow monitoring for the project, and the reasons it was finally dropped from the project scope.

Before the sampling portion of the project began, flow was monitored at the main inlet and outlet of the DTS. Detailed procedures are included in the Quality Assurance Project Plan (QAPP; King County 2015). Initially, bubblers were installed at both locations, but preliminary flow data suggested there were issues with how the instruments were calculating flow. The calculated total volumes were much greater at the inlet than the outlet, whereas they should be relatively comparable given the DTS design. The first step was to verify that the variables used to calculate flow from the bubbler data were correct. The field team verified that the inputs to the Manning equation were correct, including investigating whether the slope of the pipes given on the as-builts matched those measured in the field. Small corrections after this investigation did not explain the large discrepancy between the inlet and outlet.

After further observation, the field team realized some storms created conditions where flow monitoring was not possible with the proposed equipment. For example, bubblers cannot account for flow in a submerged pipe, which would occur at the inlet pipe during moderate storms. Additionally, moderate storms were creating violent, sporadic surging of water from the flow control structure into the outlet pipe. This condition resulted in inadequate pressure being applied to the bubbler line. Installing an area velocity meter (11/10/2015) solved the monitoring issue at the inlet pipe, but monitoring the turbulent conditions at the outlet pipe could not be resolved within the original project scope. Flow monitoring was discontinued at the outlet at the end of 2015, and evaluating the flow control benefits of the DTS was dropped from the project objectives. Flow monitoring at the DTS inlet continued periodically until January 2017.

Due to inconsistent monitoring and the issues outlined above, the report does not include any analysis of flow. All preliminary flow data for the project were included in sampling and analysis (Task 2) deliverables and are posted on the Washington State Department of Ecology website (http://www.ecy.wa.gov/programs/wq/stormwater/municipal/rsmp/effective.html), or are available upon request.

Appendix J:
Annotated Summary of Maintenance Requirements and Actions

This page intentionally left blank.

APPENDIX J –MAINTENANCE ACTIONS

As described in Section 2.3 of the main report, maintenance issues were impeding treatment at the bioretention planter boxes (BPBs) and Filterra® at various points of the study. The following provides a log of the maintenance performed at the site by City of Shoreline contracts (Table J-1). Despite these efforts, the BPB inlets (i.e., curb cuts to roadway) were frequently blocked. The project field crew frequently cleared the inlets to the BPB. They estimated curb cuts would need to be cleared as frequently as every other week at the height of the storm season to maintain their function.

It was unclear how street sweeping affected these maintenance needs. The field crew observed that sweeping would sometimes clear the BPB curb cuts, and other times block them more completely. This could be due to a several variables, including the distance of the sweeper from curb, the amount of debris on the roadway, and the time elapsed since the last curb cut cleaning.

Additionally, the Filterra were draining at the beginning of this project. The media was replaced in September 2015. By the end of the project sampling period in March 2017 the media again needed to be replaced. It is likely that the Filterra were plugged by sediment build up at the surface of the media.

Table J-1. Maintenance completed through City of Shoreline based on annual inspection results.

Study ID	City Asset ID	Maintenance Type	Date Completed
BPB1	BR-20	Cleared Inlet	3/31/2015

FLT1	FA7	Cleared Inlet	8/19/2016
FLT1	FA7	Replaced Mulch	1/20/2017
FLT1	FA7	Cleared Inlet	1/20/2017

Additional Maintenance Provided through City of Shoreline:

- Street sweeping is conducted on a monthly schedule. This was consistent throughout the study period.
- Contractor was tasked with clearing inlets at BMP assets on monthly schedule throughout the year; however, this was not consistently done.

Figure J-1. Debris blocking curb cuts at BPB1 inlet (January 21, 2016).

Figure J-2. Clearing debris blocking curb cuts at BPB1 inlet (December 3, 2015).

Figure J-3. Sediment at the top of Filterra media (April 4, 2014).

Figure J-3. Sparse vegetation and yellowed trees at BPB2 - this did not appear to affect performance (October 26, 2016).
