

Lower Satsop River Floodplain Restoration Project

The Washington Department of Fish and Wildlife (WDFW) has been funded by the Chehalis Flood Control Authority to restore natural riverine habitat processes and floodplain connectivity along the lower Satsop River to

- reduce bank erosion,
- protect agricultural soils, and
- improve fish and wildlife habitat

Phase 2 of this project will build on the recently completed Phase 1 Satsop River Riprap Removal Restoration Project and former work by the Army Corp of Engineers. Previous work developed background information and identified a range of conceptual alternatives for floodplain restoration and infrastructure protection. The benefits and impacts of the most promising alternatives will be further evaluated as part of this phase of the project. Together with project stakeholders, a preferred alternative will be selected; this alternative will be developed to a 60% design level.

Please join WDFW and the project team to learn more about this project and your role in its success. We will review the history of the project and the next steps toward development of the project alternatives. Your knowledge of the river and surrounding infrastructure is a key to developing a successful project.

SATSOP RIVER KICK-OFF MEETING:

**March 25, 2014 6:30 – 830 pm
Brady Fire Hall**
